1. Introduction

This book is one outcome of an attempt to address issues relating to statistics at the pre-college level through the creation of an interdisciplinary working group consisting of mathematics educators, cognitive scientists, teachers, and statisticians. The brief was to address the challenge in a manner that could help teachers and researchers make informed decisions about how to introduce statistics in grades K-12. A premise shared by the contributors is that by introducing statistics in the K-12 period, students will be better prepared for decision making in the real world. This volume represents an interdisciplinary effort to construct an understanding of how to enhance statistics education and assessment for students in elementary and secondary schools.

2. An overview of the book

2.1 Section 1: “Statistical Content for School Mathematics”

In the first section – on the statistical content of school mathematics – it is rightly pointed out, the issues of *statistical content and conceptual understanding* need to be investigated concurrently, and there is a dearth of such studies. Nevertheless some progress has been made, and one aim of this book is to encourage further work. At this level in particular the issue of how *informal knowledge* can be used as a guide to instruction is important. Most work has been in the rather limited field of probability, but work on children’s intuitions about modelling is reported. As the introduction says, “only by documenting cognitive skills and the characteristics that differentiate the skilled from the unskilled learner for each content area ... can we improve the teaching and assessment of such under-

standing”. The section provides a clear indication of the capabilities of high school students and how progression can be promoted. A significant theme is the need to develop critical skills and attitude to statistical data, rather than simply computational and presentational skills. This is exemplified by the laudable assertion that “every high-school graduate must be educated to be an intelligent consumer of data ... and to judge the value of data produced by others”. The point is well made that statistics is about numbers *in context*.

2.2 Section 2: “Teaching Statistics”

The second section has chapters on graphical representation and professional development for teachers. The authors address the issue of how to build on students’ prior knowledge in the context of graphical representation and data interpretation, emphasising the construction of relationships and extending understanding through multiple contexts. There is discussion of the problems of teacher education and an innovative professional development programme is described.

2.3 Section 3: “Learning Statistics”

The third section contains three chapters. The first two provide detailed examinations of the development of understanding of chance and uncertainty, demonstrating transitions in mental models of statistical understanding. The third chapter explores simulations as vehicles for statistical understanding.

2.4 Section 4: “Assessing Statistics”

The fourth section is on assessment which has an important role in both shaping the curriculum and informing teacher and student of progress made. The point is made that statistical understanding is difficult to define and assess in general terms and communication is a key concept. Verbal rather than written modes of working (and assessing) may be more appropriate, and multiple methods of assessment need to be encouraged. A theme throughout the book is the need to marry instruction and assessment into a unified whole curriculum.

3. A closer look at chapters of the book

3.1 Chapter 1: “What every high school graduate should know”

This chapter, by the respected authorities Sheaffer, Watkins and Landwehr, is a *tour de force* of statistics at the school level, with excellent sections on number sense, variables,

Statistical Literacy at School Jane M. Watson, 2013-05-13 This book reveals the development of students understanding of statistical literacy It provides a way to see student thinking and gives readers a deeper sense of how students think about important statistical topics Intended as a complement to curriculum documents and textbook series it is consistent with the current principles and standards of the National Council of Teachers of Mathematics The term statistical literacy is used to emphasize that the purpose of the school curriculum should not be to turn out statisticians but to prepare statistically literate school graduates who are prepared to participate in social decision making Based on ten years of research with reference to other significant research as appropriate the book looks at students thinking in relation to tasks based on sampling graphical representations averages chance beginning inference and variation which are essential to later work in formal statistics For those students who do not proceed to formal study as well as those who do these concepts provide a basis for decision making or questioning when presented with claims based on data in societal settings Statistical Literacy at School Growth and Goals establishes an overall framework for statistical literacy in terms of both the links to specific school curricula and the wider appreciation of contexts within which chance and data handling ideas are applied demonstrates within this framework that there are many connections among specific ideas and constructs provides tasks adaptable for classroom or assessment use that are appropriate for the goals of statistical literacy presents extensive examples of student performance on the tasks illustrating hierarchies of achievement to assist in monitoring gains and meeting the goals of statistical literacy and includes a summary of analysis of survey data that suggests a developmental hierarchy for students over the years of schooling with respect to the goal of statistical literacy Statistical Literacy at School Growth and Goals is directed to researchers curriculum developers professionals and students in mathematics education as well those across the curriculum who are interested in students cognitive development within the field to teachers who want to focus on the concepts involved in statistical literacy without the use of formal statistical techniques and to statisticians who are interested in the development of student understanding before students are exposed to the formal study of statistics

The Nature of Mathematical Thinking Robert J. Sternberg, Talia Ben-Zeev, 2012-10-12 Why do some children seem to learn mathematics easily and others slave away at it learning it only with great effort and apparent pain Why are some people good at algebra but terrible at geometry How can people who successfully run a business as adults have been failures at math in school How come some professional mathematicians suffer terribly when trying to balance a checkbook And why do school children in the United States perform so dismally in international comparisons These are the kinds of real questions the editors set out to answer or at least address in editing this book on mathematical thinking Their goal was to seek a diversity of contributors representing multiple viewpoints whose expertise might converge on the answers to these

and other pressing and interesting questions regarding this subject The chapter authors were asked to focus on their own approach to mathematical thinking but also to address a common core of issues such as the nature of mathematical thinking how it is similar to and different from other kinds of thinking what makes some people or some groups better than others in this subject area and how mathematical thinking can be assessed and taught Their work is directed to a diverse audience psychologists interested in the nature of mathematical thinking and abilities computer scientists who want to simulate mathematical thinking educators involved in teaching and testing mathematical thinking philosophers who need to understand the qualitative aspects of logical thinking anthropologists and others interested in how and why mathematical thinking seems to differ in quality across cultures and laypeople and others who have to think mathematically and want to understand how they are going to accomplish that feat

The Jasper Project John D. Bransford, 2013-10-11 During the past decade members of the Cognition and Technology Group at Vanderbilt University have worked with hundreds of teachers and thousands of students throughout North America in the context of the Adventures of Jasper Woodbury problem solving series 12 videodisc based adventures plus video based analogs extensions and teaching tips designed to improve the mathematical thinking of students from grades 5 and up and to help them make connections to other disciplines such as science history and social studies The experience of developing the Jasper series testing it in classrooms

and re designing it based on feedback provided The Cognition and Technology Group at Vanderbilt with extraordinarily rich opportunities to learn from teachers students parents administrators and other community members This book was written for two reasons First it helped the authors to organize the thoughts and experiences of over 70 members of the Learning Technology Center who worked on the Jasper project and to collaboratively reflect on their experiences and relate them to the broader literature in cognition and instruction Second this book gives others a change to learn from the experiences of the Cognition and Technology Group at Vanderbilt The book is anchored around their experiences with Jasper but the issues explored are relevant to any attempt to improve educational practice This book tells a coherent story that helps readers explore issues of curriculum instruction assessment and teacher learning professional development within a single context Jasper and how all these topics are interrelated It also helps readers see the relevance of research programs for improving educational practice Throughout the need for maintaining a balance of laboratory and classroom research is emphasized
