Riemann Surfaces And Generalized Theta Functions Ergebnisse Der Mathematik Und Ihrer Grenzgebiete:

Riemann Surfaces and Generalized Theta Functions Robert C. Gunning, 2012-12-06 The investigation of the relationships between compact Riemann surfaces algebraic curves and their associated complex tori Jacobi varieties has long been basic to the study both of Riemann surfaces and of complex tori A Riemann surface is naturally imbedded as an analytic submanifold in its associated torus and various spaces of linear equivalence classes of divisors on the surface or equivalently spaces of analytic equivalence classes of complex line bundles over the surface classified according to the dimensions of the associated linear series or the dimensions of the spaces of analytic cross sections are naturally realized as analytic subvarieties of the associated torus One of the most fruitful of the classical approaches to this investigation has been by way of theta functions The space of linear equivalence classes of positive divisors of order $g+1$ on a compact connected Riemann surface M of genus g is realized by an irreducible $g+1$ dimensional analytic subvariety an irreducible hypersurface of the associated g dimensional complex torus $J(M)$ this hyperplane surface $W_{g+1}(M)$ is the image of the natural mapping $M \times J(M) \rightarrow J(M)$ and is $g+1$ birationally equivalent to the $g+1$ fold symmetric product $M^{(g+1)}$ of the Riemann surface M *A Course in Complex Analysis and Riemann Surfaces* Wilhelm Schlag, 2014-08-06 Complex analysis is a cornerstone of mathematics making it an essential element of any area of study in graduate mathematics Schlag's treatment of the subject emphasizes the intuitive geometric underpinnings of elementary complex analysis that naturally lead to the theory of Riemann surfaces The book begins with an exposition of the basic theory of holomorphic functions of one complex variable The first two chapters constitute a fairly rapid but comprehensive course in complex analysis The third chapter is devoted to the study of harmonic functions on the disk and the half plane with an emphasis on the Dirichlet problem Starting with the fourth chapter the theory of Riemann surfaces is developed in some detail and with complete rigor From the beginning the geometric aspects are emphasized and classical topics such as elliptic functions and elliptic integrals are presented as illustrations of the abstract theory The special role of compact Riemann surfaces is explained and their connection with algebraic equations is established The book concludes with three chapters devoted to three major results the Hodge decomposition theorem the Riemann-Roch theorem and the uniformization theorem These chapters present the core technical apparatus of Riemann surface theory at this level This text is intended as a detailed yet fast paced intermediate introduction to those parts of the theory of one complex variable that seem most useful in other areas of mathematics including geometric group theory dynamics algebraic geometry number theory and functional analysis More than seventy figures serve to illustrate concepts and ideas and the many problems at the end of each chapter give the reader ample opportunity for practice and independent study **Advances on Superelliptic Curves and Their Applications** Lubjana Beshaj, Eustrat Zhupa, 2015-07-15 This book had its origins in the NATO Advanced Study Institute ASI held in Ohrid Macedonia in 2014 The focus of this ASI was the arithmetic of superelliptic curves and their application in different scientific areas including whether all the applications of

hyperelliptic curves such as cryptography mathematical physics quantum computation and diophantine geometry can be carried over to the superelliptic curves Additional papers have been added which provide some background for readers who were not at the conference with the intention of making the book logically more complete and easier to read but familiarity with the basic facts of algebraic geometry commutative algebra and number theory are assumed The book is divided into three sections The first part deals with superelliptic curves with regard to complex numbers the automorphisms group and the corresponding Hurwitz loci The second part of the book focuses on the arithmetic of the subject while the third addresses some of the applications of superelliptic curves

Complex Analysis 2 Eberhard Freitag, 2011-06-10 The book contains a complete self contained introduction to highlights of classical complex analysis New proofs and some new results are included All needed notions are developed within the book with the exception of some basic facts which can be found in the first volume There is no comparable treatment in the literature

Conformal Blocks, Generalized Theta Functions and the Verlinde Formula Shrawan Kumar, 2021-11-25 In 1988 E Verlinde gave a remarkable conjectural formula for the dimension of conformal blocks over a smooth curve in terms of representations of affine Lie algebras Verlinde's formula arose from physical considerations but it attracted further attention from mathematicians when it was realized that the space of conformal blocks admits an interpretation as the space of generalized theta functions A proof followed through the work of many mathematicians in the 1990s This book gives an authoritative treatment of all aspects of this theory It presents a complete proof of the Verlinde formula and full details of the connection with generalized theta functions including the construction of the relevant moduli spaces and stacks of G bundles Featuring numerous exercises of varying difficulty guides to the wider literature and short appendices on essential concepts it will be of interest to senior graduate students and researchers in geometry representation theory and theoretical physics

Algebraic Curves and Riemann Surfaces Rick Miranda, 2025-10-10 The book was easy to understand with many examples The exercises were well chosen and served to give further examples and developments of the theory William Goldman University of Maryland In this book Miranda takes the approach that algebraic curves are best encountered for the first time over the complex numbers where the reader's classical intuition about surfaces integration and other concepts can be brought into play Therefore many examples of algebraic curves are presented in the first chapters In this way the book begins as a primer on Riemann surfaces with complex charts and meromorphic functions taking center stage But the main examples come from projective curves and slowly but surely the text moves toward the algebraic category Proofs of the Riemann-Roch and Serre Duality Theorems are presented in an algebraic manner via an adaptation of the adelic proof expressed completely in terms of solving a Mittag-Leffler problem Sheaves and cohomology are introduced as a unifying device in the latter chapters so that their utility and naturalness are immediately obvious Requiring a background of one semester of complex variable theory and a year of abstract algebra this is an excellent graduate textbook for a second semester course in complex variables or a year long

course in algebraic geometry Moduli Spaces and Vector Bundles—New Trends Peter Gothen, Margarida Melo, Montserrat Teixidor i Bigas, 2024-07-18 This volume contains the proceedings of the VBAC 2022 Conference on Moduli Spaces and Vector Bundles New Trends held in honor of Peter Newstead's 80th birthday from July 25-29, 2022 at the University of Warwick, Coventry, United Kingdom. The papers focus on the theory of stability conditions in derived categories, non-reductive geometric invariant theory, Brill-Noether theory, and Higgs bundles and character varieties. The volume includes both survey and original research articles. Most articles contain substantial background and will be helpful to both novices and experts.
