Nitride Semiconductors and Devices Hadis Morkoç, 2013-03-08 A View of the Past and a Look into the Future by a Pioneer By Jacques I Pankove This forward will be a brief review of important developments in the early and recent history of gallium nitride and also a perspective on the current and future evolution of this exciting field Gallium nitride GaN was synthesized more than 50 years ago by Johnson et al 1 in 1932 and also by Juza and Hahn 2 in 1938 who passed ammonia over hot gallium This method produced small needles and platelets The purpose of Juza and Hahn was to investigate the crystal structure and lattice constant of GaN as part of a systematic study of many compounds Two decades later Grim et al 3 in 1959 employed the same technique to produce small crystals of GaN for the purpose of measuring their photoluminescence spectra Another decade later Maruska and Tietjen 4 in 1969 used a chloride transport vapor technique to make a large area layer of GaN on sapphire All of the GaN made at that time was very conducting n type even when not deliberately doped The donors were believed to be nitrogen vacancies Later this model was questioned by Seifert et al 5 in 1983 and oxygen was proposed as the donor Oxygen with its 6 valence electrons on a N site N has 5 valence electrons would be a single donor

Fred Schubert, 2006-01-01 Revised and fully updated the Second Edition of this textbook offers a comprehensive explanation of the technology and physics of light emitting diodes. LEDs such as infrared, visible spectrum, ultraviolet and white LEDs made from III-V semiconductors. The elementary properties of LEDs such as electrical and optical characteristics are reviewed followed by the analysis of advanced device structures. With nine additional chapters the treatment of LEDs has been vastly expanded including new material on device packaging, reflectors, UV LEDs, III-V nitride materials, solid state sources for illumination applications and junction temperature. Radiative and non radiative recombination dynamics, methods for improving light extraction, high efficiency and high power device designs, white light emitters with wavelength converting phosphor materials, optical reflectors and spontaneous recombination in resonant cavity structures are discussed in detail. Fields related to solid state lighting such as human vision, photometry, colorimetry and color rendering are covered beyond the introductory level provided in the first edition. The applications of infrared and visible spectrum LEDs in silica fiber, plastic fiber and free space communication are also discussed. Semiconductor material data, device design data and analytic formulae governing LED operation are provided. With exercises, solutions and illustrative examples, this textbook will be of interest to scientists and engineers working on LEDs and to graduate students in electrical engineering, applied physics and materials science. **Compound**
