Rivers Over Rock Keith J. Tinkler, Ellen Wohl, 1998-02-04 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 107 Bedrock river channels are sites of primary erosion in the landscape fixing the baselevel for all points upstream This volume provides for the first time an integrated view of the characteristics and operation of this important though hitherto neglected class of channels Examples are provided from several continents and cover a wide range of spatial scales from the large river basins such as the Colorado River in the United States and the Indus River in Pakistan down to reach scales and individual sites Likewise the geologic timescales considered range from erosion and transportation during individual flows to accumulated effects over periods of tens of millions of years Geomorphic Analysis of River Systems Kirstie A. Fryirs, Gary J. Brierley, 2012-09-26 Filling a niche in the geomorphology teaching market this introductory book is built around a 12 week course in fluvial geomorphology Reading the landscape entails making sense of what a riverscape looks like how it works how it has evolved over time and how alterations to one part of a catchment may have secondary consequences elsewhere over different timeframes These place based field analyses are framed within their topographic climatic and environmental context Issues and principles presented in the first part of this book provide foundational understandings that underpin the approach to reading the landscape that is presented in the second half of the book In reading the landscape detective style investigations and interpretations are tied to theoretical and conceptual principles to generate catchment specific analyses of river character behaviour and evolution including responses to human disturbance This book has been constructed as an introductory text on river landscapes providing a bridge and or companion to quantitatively framed or modelled approaches to landscape analysis that are addressed elsewhere Key principles outlined in the book emphasise the importance of complexity contingency and emergence in interpreting the character behaviour and evolution of any given system The target audience is second and third year undergraduate students in geomorphology hydrology earth science and environmental science as well as river practitioners who use geomorphic understandings to guide scientific and or management applications The primary focus of Kirstie and Gary s research and teaching entails the use of geomorphic principles as a tool with which to develop coherent scientific understandings of river systems and the application of these understandings in management practice Kirstie and Gary are co developers of the River Styles Framework and Short Course that is widely used in river management decision making and training Additional resources for this book can be found at www.wiley.com/go/fryirs/riversystems **River Confluences, Tributaries and the Fluvial Network** Stephen Rice, Andre Roy, Bruce Rhoads, 2008-07-31 River Confluences and the Fluvial Network brings together state of the art thinking on confluence dynamics tributary impacts and the links between processes at these scales and river network functions The book is unique in focus content scope and in bringing together engineering ecological and geomorphological approaches to the three key areas of river system science Taking a global approach this multi authored

Volcanic and Tectonic Hazard Assessment for Nuclear Facilities Charles B. Connor, Neil A. Chapman, Laura J. Connor, 2009-08-27 Geoscientists worldwide are developing and applying methodologies to estimate geologic hazards associated with the siting of nuclear facilities Understanding such hazards particularly in the context of the long functional lifetimes of many nuclear facilities is challenging This book documents the current state of the art in volcanic and tectonic hazard assessment for proposed nuclear facilities which must be located in areas where the risks associated with geologic processes are quantifiable and demonstrably low Specific topics include overviews of volcanic and tectonic processes the history of development of hazard assessment methodologies description of current techniques for characterizing hazards and development of probabilistic methods for estimating risks Hazard assessment examples are drawn from around the world

This volume will promote interest and debate about this important topic among researchers and graduates developing methods in geologic hazard assessment geologists and engineers who assess the safety of nuclear facilities and regulatory bodies that evaluate such assessments **Tools in Fluvial Geomorphology** G. Turkington,J. Phillips,S. Campbell,Sean W. Campbell,2005-08-04 In recognition of the fundamental control exerted by weathering on landscape evolution and topographic development the 35th Binghamton Geomorphology Symposium was convened under the theme of Weathering and Landscape Evolution The papers and posters presented at the conference imparted the state of the art in weathering geomorphology tackled the issue of scale linkage in geomorphic studies and offered a vehicle for interdisciplinary communication on research into weathering and landscape evolution The papers included in this book are

encapsulated here under the general themes of weathering mantles weathering and relative dating weathering and denudation weathering processes and controls and the big picture Contains 15 papers on the techniques and methodologies of research Provides an up to date overview of various aspects of weathering and landscape evolution complemented by a number of excellent case studies Contains a wealth of basic field data and relevant information *U.S. Geological Survey Circular* ,2004

Integration of Computer Modeling and Field Observations in Geomorphology J.F. Shroder,M.P. Bishop,2003-09-26 The integration of classic field gathered data with new computer models has allowed many new advances in geomorphology which the 31st Binghamton Millennium Symposium 2000 presents in this latest of the well known Binghamton book series the Integration of Computer Modeling and Field Observations in Geomorphology Conceptual models have been most commonly inferred from analyses of topography and investigator perspectives derived from fieldwork The main stumbling blocks to understanding surface processes their interactions temporal changes and resulting landforms are the difficulty of observation geological timescales involved spatial scale dependencies and the inability to attribute differences to either process or age Physically based computer models have thus become essential tools primarily because of their ability to explore spatial and temporal trends and to determine the sensitivity of physical inputs to change without the difficulties of identification and generalization associated with the complexity of field studies Thus the combination of both methods or the integration of field methods with computer modeling become a very powerful mechanism for robust understanding This new book presents topics on fluvial processes of overland and channelized flow in arid humid and periglacial areas of high and low relief as well as work on interlinked biogeographic and geomorphic fluctuations in alpine terrain and ground penetrating radar of coastal geomorphology Issues of long term evolution of drainage networks are addressed in natural systems as well as stream table environments and terrain analyses characterize surficial and subsurface geomorphic features by using GIS and remote sensing Botanical and biogeomorphologic controls of landforms are assessed along with issues of scientific visualization cartographic representation DEMs spatial analyses and scale dependencies
