*Color Constancy*

Marc Ebner, 2007-04-30 A human observer is able to recognize the color of objects irrespective of the light used to illuminate them This is called color constancy A digital camera uses a sensor to measure the reflected light meaning that the measured color at each pixel varies according to the color of the illuminant Therefore the resulting colors may not be the same as the colors that were perceived by the observer Obtaining color constant descriptors from image pixels is not only important for digital photography but also valuable for computer vision color based automatic object recognition and color image processing in general This book provides a comprehensive introduction to the field of color constancy describing all the major color constancy algorithms as well as presenting cutting edge research in the area of color image processing Beginning with an in depth look at the human visual system Ebner goes on to examine the theory of color image formation color reproduction and different color spaces discuss algorithms for color constancy under both uniform and non uniform illuminants describe methods for shadow removal and shadow attenuation in digital images evaluate the various algorithms for object recognition and color constancy and compare this to data obtained from experimental psychology set out the different algorithms as pseudo code in an appendix at the end of the book Color Constancy is an ideal reference for practising engineers computer scientists and researchers working in the area of digital color image processing It may also be useful for biologists or scientists in general who are interested in computational theories of the visual brain and bio inspired engineering systems

Improving image quality in multi-channel printing - multilevel halftoning, color separation and graininess characterization Paula Žitinski Elías, 2017-03-13 Color printing is traditionally achieved by separating an input image into four channels CMYK and binarizing them using halftoning algorithms in order to designate the locations of ink droplet placement Multi channel printing means a reproduction that employs additional inks other than these four in order to augment the color gamut scope of reproducible colors and reduce undesirable ink droplet visibility so called graininess One aim of this dissertation has been to characterize a print setup in which both the primary inks CMYK and their light versions are used The presented approach groups the inks forming subsets each representing a channel that is reproduced with multiple inks To halftone the separated channels in the present methodology a specific multilevel halftoning algorithm is employed halftoning each channel to multiple levels This algorithm performs the binarization from the ink subsets to each separate colorant Consequently the print characterization complexity remains unaltered when employing the light inks avoiding the normal increase in computational complexity the one to many mapping problem and the increase in the number of training samples The results show that the reproduction is visually improved in terms of graininess and detail enhancement The secondary color inks RGB are added in multi channel printing to increase the color gamut Utilizing them however potentially increases the perceived graininess Moreover employing the primary secondary and light inks means a color separation from a three channel CIELAB space into a multi channel colorant space resulting in colorimetric redundancy in which multiple ink combinations can reproduce the same target color To address this a proposed cost function is

incorporated in the color separation approach weighting selected factors that influence the reproduced image quality i.e graininess and color accuracy in order to select the optimal ink combination The perceived graininess is modeled by employing S CIELAB a spatial low pass filtering mimicking the human visual system By applying the filtering to a large dataset a generalized prediction that quantifies the perceived graininess is carried out and incorporated as a criterion in the color separation Consequently the presented research increases the understanding of color reproduction and image quality in multi channel printing provides concrete solutions to challenges in the practical implementation and rises the possibilities to fully utilize the potential in multi channel printing for superior image quality

**Handbook of Optical and Laser Scanning** Gerald F. Marshall, Glenn E. Stutz, 2018-10-08 From its initial publication titled Laser Beam Scanning in 1985 to Handbook of Optical and Laser Scanning now in its second edition this reference has kept professionals and students at the forefront of optical scanning technology Carefully and meticulously updated in each iteration the book continues to be the most comprehensive scanning resource on the market It examines the breadth and depth of subtopics in the field from a variety of perspectives The Second Edition covers Technologies such as piezoelectric devices Applications of laser scanning such as Ladar laser radar Underwater scanning and laser scanning in CTP As laser costs come down and power and availability increase the potential applications for laser scanning continue to increase Bringing together the knowledge and experience of 26 authors from England Japan and the United States the book provides an excellent resource for understanding the principles of laser scanning It illustrates the significance of scanning in society today and would help the user get started in developing system concepts using scanning It can be used as an introduction to the field and as a reference for persons involved in any aspect of optical and laser beam scanning
