The study of molecular Rydberg states is a rapidly growing interdisciplinary field. This valuable report constituting the proceedings of a Royal Society Discussion reflects the state of the present theoretical knowledge and includes an introductory chapter for the non specialist. The material is organised to bring out the wealth of observable effects. Some states commonly lead to competitive predissociation and autoionization with relevance to atmospheric and astrophysical processes. Others with higher angular momenta have much longer lifetimes and high electronic degeneracies which on one hand pose subtle problems for experimental interpretation and on the other act as reservoirs for a class of remarkably stable so called ZEKE states. New experiments to classify the formation mechanism of such states and to exploit their properties are described. The interplay between quantum defect and ab initio aspects of the theory is also underlined. **Chemical**

Reactions and Their Control on the Femtosecond Time Scale Pierre Gaspard, Irene Burghardt, 2009-09-09. Continuing the tradition of the Advances in Chemical Physics series Volume 101, **Chemical Reactions and Their Control on the Femtosecond Time Scale** details the extraordinary findings reported at the XXth Solvay Conference on Chemistry held at the Universite Libre de Bruxelles Belgium from November 28 to December 2 1995. This new volume discusses the remarkable opportunities afforded by the femtosecond laser focusing on the host of phenomena this laser has made it possible to observe. Examining molecules on the intrinsic time scale of their vibrations as well as their dissociative motions and electronic excitations represents only part of a broadened scientific window made possible by the femtosecond laser. The assembled studies with follow up discussions reflect the many specialties and perspectives of the Conference's 65 participants as well as their optimism concerning the breadth of scientific discovery now open to them. The studies shed light on the laser's enhanced technical reach in the area of coherent control of chemical reactions as well as of more general quantum systems. The theoretical fundamentals of femtochemistry, the unique behavior of the femtosecond laser and a view toward future technological applications were also discussed. Femtochemistry, chemical reaction dynamics and their control, Coherent control with femtosecond laser pulses, Femtosecond chemical dynamics in condensed phases, Control of quantum many body dynamics, Experimental observation of laser control, Solvent dynamics and RRKM theory of clusters, High resolution spectroscopy and intramolecular dynamics, Molecular Rydberg states and ZEKE spectroscopy, Transition state spectroscopy and photodissociation, Quantum and semiclassical theories of chemical reaction rates. A fascinating and informative status report on the cutting edge chemical research made possible by the femtosecond laser. **Chemical Reactions and Their Control on the Femtosecond Time Scale** is an indispensable volume for professionals and students alike. The femtosecond laser and chemistry's extraordinary new frontier of molecular motions observed on the scale of a quadrillionth of a second. Research chemists have only tapped the surface of the spectacular reach and precision of the femtosecond laser, a technology that has allowed them to observe the dynamics of molecules on the intrinsic time scale of their vibrations, dissociative motions and electronic excitations. Volume 101 in the Advances in Chemical Physics series, **Chemical Reactions and Their Control on the**

Femtosecond Time Scale details their extraordinary findings presented at the XXth Solvay Conference on Chemistry in Brussels. The studies reflect the work in part of the Conference's 65 participants including many prominent contributors. Together they shed light on the laser's enhanced technical range in the area of coherent control of chemical reactions as well as of more general quantum systems. The theoretical fundamentals of femtochemistry, the unique behavior of the femtosecond laser, and a view toward future technological applications were also discussed. An exceptionally up-to-date examination of the chemical analyses made possible by the femtosecond laser, *Chemical Reactions and Their Control on the Femtosecond Time Scale*, is an important reference for professionals and students interested in enhancing their research capabilities with this remarkable tool. From 1993 to 1996 she worked with Dr P Gaspard at the Universite Libre de Bruxelles, Belgium, on the application of new semiclassical techniques to elementary chemical reaction processes. **Molecular Applications of**

Quantum Defect Theory Ch Jungen, 2019-01-22. As a consequence of new experimental techniques in optical and collision physics such as multiphoton excitation and VUV radiation generation, quantum defect theory (QDT) has become more widely used as a theoretical tool for experimentalists. Drawing together a historical body of work that contains key research and review papers, *Molecular Applications of Quantum Defect Theory* is a valuable resource. *Tutorials in Molecular Reaction Dynamics* Mark Brouard, Claire Vallance, 2015-11-09. The focus of this excellent textbook is the topic of molecular reaction dynamics. The chapters are all written by internationally recognised researchers and from the outset the contributors are writing with the young scientist in mind. The easy-to-use stand-alone chapters make it of value to students, teachers, and researchers alike. Subjects covered range from the more traditional topics such as potential energy surfaces to more advanced and rapidly developing areas such as femtochemistry and coherent control. The coverage of reaction dynamics is very broad so many students studying chemical physics will find elements of this text interesting and useful. *Tutorials in Molecular Reaction Dynamics* includes extensive references to more advanced texts and research papers, and a series of Study Boxes help readers grapple with the more difficult concepts. Each chapter is thoroughly cross-referenced, helping the reader to link concepts from different branches of the subject. Worked problems are included, and each chapter concludes with a selection of problems designed to test understanding of the subjects covered. Supplementary reading material and worked solutions to the problems are contained on a secure website.

Molecular Conformation and Organic Photochemistry Rasmus Y. Brogaard, 2012-05-17. Rasmus Brogaard's thesis digs into the fundamental issue of how the shape of a molecule relates to its photochemical reactivity. This relation is drastically different from that of ground state chemistry since lifetimes of excited states are often comparable to or even shorter than the time scales of conformational changes. Combining theoretical and experimental efforts in femto-second time resolved photoionization, Rasmus Brogaard finds that a requirement for an efficient photochemical reaction is the prearrangement of the constituents in a reactive conformation. Furthermore, he is able to show that by exploiting a strong ionic interaction between two chromophores, a coherent molecular motion can be induced and probed in real time. This way of using

bichromophoric interactions provides a promising strategy for future research on conformational dynamics

Photochemistry Oliver Schalk, Enrico Tapavicza, 2021-03-30 Photochemistry is an important part of both chemistry and biology and is of great practical significance for the development of sustainable sources of energy The mechanisms of photochemistry are far from trivial and far from understood There are limits to how well theory can describe the processes and how well experiments can resolve them This book aims to provide an overview of state of the art methods for both theoretical development and experimental techniques with a focus on ultrafast molecular processes and electronic excitation of organic molecules These fields are active and progress is being made carried by the increasing speed of computation and the development of new light sources most notably X ray sources at large facilities Alongside these two layers of theoretical development and experimental techniques is a third layer model building In this layer model building tries to find similarities in seemingly unrelated experimental results and deepen our general knowledge of photoinduced processes Often progress is made not by cutting edge techniques but rather by using well established techniques with a great variety of molecules this approach promises less glory but is just as important as the first two layers Examples mentioned in the text are the Woodward Hoffman rules and the dynamophore concept All three layers are crucial to push our knowledge further and eventually to use it for developing new and more advanced optical devices
