Wall,1992 *Producing Liquid Fuels from Coal* James T. Bartis, Frank A. Camm, David Santana Ortiz, 2008 Record high world oil prices have prompted renewed interest in producing liquid fuels from coal The United States leads the world in recoverable coal reserves Moreover the technology for converting coal to liquid fuels already exists and production costs appear competitive at world oil prices well below current levels Yet despite its promise private investment in coal to liquids CTL technology is being impeded by three uncertainties where oil prices are heading what it actually costs to produce coal derived fuels and how greenhouse gas emissions will be regulated A domestic CTL industry could produce as much as three million barrels per day of transportation fuels by 2030 Having such an industry would yield important energy security benefits most notably a lowering of world oil prices and a decrease in wealth transfers from oil users to oil producers But establishing a large CTL industry also raises important policy and environmental issues associated with climate change coal mining and water consumption Weighing both benefits and costs it makes sense for the United States to pursue an insurance or hedge strategy that promotes the early construction and operation of a limited number of commercial CTL plants This book presents an in depth review of the prospects of and policy governance and environmental issues associated with establishing a CTL industry in the United States provided by publisher *Engineers, Society, and Sustainability* Sarah Bell, 2022-06-01 Sustainable development is one of the key challenges of the twenty first century The engineering profession is central to achieving sustainable development To date engineering contributions to sustainability have focused on reducing the environmental impacts of development and improving the efficiency of resource use This approach is consistent with dominant policy responses to environmental problems which have been characterised as ecological modernisation Ecological modernisation assumes that sustainability can be addressed by reforming modern society and developing environmental technologies Environmental philosophers have questioned these assumptions and call into question the very nature of modern society as underlying the destruction of nature and the persistence of social inequality Central to the crises of ecology and human development are patterns of domination and the separation of nature and culture Engineering has a clear role to play in ecological modernisation but its role in more radical visions of sustainability is uncertain Actor network theory provides an analysis of socio technical systems which does not require the separation of nature and culture and it provides a way of thinking about how engineers are involved in shaping society and its relationship to the environment It describes the world in terms of relationships between human and non human actors It shows that social relationships are mediated by technologies and non human nature and that assumptions about society and behaviour are baked in to technological systems

Modern infrastructure systems are particularly important in shaping society and have significant environmental impacts. Modern infrastructure has allowed the consumption of resources far beyond basic human needs in developed countries. Failure to deliver infrastructure services has resulted in billions of the world's poorest people missing out on the benefits of modern development. Engineers have an important role to play in developing new infrastructure systems which acknowledge the relationships between technology and society in shaping demand for resources and environmental impacts as well as alleviating poverty. Engineers have an important role in mediating between the values of society, clients, the environment and the possibilities of technology. Constructive Technology Assessment and Value Sensitive Design are two methodologies which engineers are using to better account for the social and ethical implications of their work. Understanding engineering as a hybrid socio-technical profession can help develop new ways of working that acknowledge the importance of technology and infrastructure in shaping social relationships that are central to achieving sustainability.

The Philosopher's Stone for Sustainability Yoshiki Shimomura, Koji Kimita, 2012-09-26

Industrial Product Service Systems (IPS2) which is defined as an integrated industrial product and service offering that delivers value in use has expanded rapidly over the last decade. IPS2 has allowed us to achieve both high added value and high productivity and has enriched our QOL by improving the performance of products and services. We are now struggling with many awkward issues related to sustainability but IPS2 is expected to be the philosopher's stone for solving these issues. Following the pattern of conferences held in Cranfield in 2009, Linköping in 2010 and Braunschweig in 2011, the fourth International CIRP Conference on Industrial Product Service Systems held on November 8-9, 2012 in Tokyo will cover various aspects of IPS2. Topics planned for this year's conference reflect the latest IPS2 information in both the natural sciences and humanities and include case studies from various industries. IPS2 is still a relatively new field so it is important to keep track of the entire context in order to promote more cross-sectional cooperation between multimodal fields and disciplines. The fourth International CIRP Conference on Industrial Product Service Systems will serve as a vital platform for such collaborations and the discussion of new scientific ideas.
