

EVALUATION OF FEMALE EXTERNAL GENITALIA SENSITIVITY TO PRESSURE/TOUCH: A PRELIMINARY PROSPECTIVE STUDY USING SEMMES-WEINSTEIN MONOFILAMENTS

LAURE J. ROMANZI, ASNAT GROUTZ, FARHA FEROZ, AND JERRY G. BLAINAS

ABSTRACT

Objectives. To assess the use of pressure aesthesiometers (Semes-Weinstein monofilaments) in the evaluation of female external genitalia. The pressure aesthesiometers are widely used to assess the pressure/touch perceptions of the hand, face, and breast dermatomes.

Methods. Thirty-two consecutive neurologically intact women (mean age 48.7 ± 13.8 years) and 5 neurologically impaired women referred for a routine gynecologic examination were prospectively enrolled. The monofilaments were applied to the S2-S5 vulvar dermatomes using specific anatomic landmarks. Test-retest reliability studies were performed at the same clinical session. A comparison was made between premenopausal ($n = 17$) and postmenopausal ($n = 15$) women; hypoestrogenic ($n = 9$) and normoestrogenic ($n = 23$) women; postmenopausal women with ($n = 6$) and without ($n = 9$) estrogen replacement therapy; women with normal ($n = 18$) and abnormal ($n = 14$) sexual function; and neurologically impaired ($n = 5$) and neurologically intact ($n = 5$) women, matched by age, parity, and estrogen status.

Results. A clear association was found between reduced vulvar sensitivity to pressure/touch and estrogen deficiency, sexual dysfunction, and neurologic impairment. Postmenopausal women had significantly reduced sensitivity to pressure/touch compared with premenopausal women. Similar decreased sensitivity was found in hypoestrogenic compared with normoestrogenic women, with significantly reduced sensitivity in postmenopausal women not using estrogen replacement therapy. Women with sexual dysfunction and those with neurologic impairment had significantly reduced vulvar sensitivity to pressure/touch. No correlation was found between the sensitivity to pressure/touch and either levator ani muscle bulk or the levator contraction score, but significant differences were found between women with and without vulvovaginal atrophy at the time of the examination. Test-retest analysis confirmed the reliability of the monofilaments in testing vulvar sensation.

Conclusions. The Semmes-Weinstein monofilaments may be used as a valid and reliable diagnostic tool in the evaluation of vulvar sensitivity to pressure/touch. Additional studies with larger series are needed to establish the role of this clinical tool in the evaluation of various treatment outcomes. **UROLOGY** 57: 1145-1150, 2001. © 2001, Elsevier Science Inc.

Normal skin sensation requires intact function of neural, vascular, endocrine, and psychogenic mechanisms. Several diagnostic tools are traditionally used to assess skin sensation, including temperature, vibratory, sharp/dull, and single-

point and two-point discrimination. Von Frey¹ was the first to use horse hair, attached to wax candles, to study single-point skin sensitivity to pressure/touch. This method is based on the principle that a fiber, pressed against the skin until it bends, produces a constant reproducible application of force. The bending force is proportional to the fiber diameter and inversely proportional to its length. Semmes et al.² and Weinstein³ further modified Von Frey's invention by using 20 nylon monofilaments (Semes-Weinstein pressure aesthesiometers; Stoelting, Wood Dale, Ill), all of equal length but of varying diameters. The diameters of the fil-
