Prestandard Commentary For The Seismic:

Prestandard and Commentary for the Seismic Rehabilitation of Buildings Federal Emergency Management Agency, 2013-04-03 The title of this document FEMA 356 Prestandard and Commentary for the Seismic Rehabilitation of Buildings incorporates a word that not all users may be familiar with That word prestandard has a special meaning within the ASCE Standards Program in that it signifies the document has been accepted for use as the start of the formal standard development process however the document has yet to be fully processed as a voluntary consensus standard The preparation of this prestandard was originally undertaken with two principal and complementary objectives The first was to encourage the wider application of the NEHRP Guidelines for the Seismic Rehabilitation of Buildings FEMA 273 by converting it into mandatory language Design professionals and building officials thus would have at their disposal a more specific reference document for making buildings more resistant to earthquakes This volume fully meets this first objective The second objective was to provide a basis for a nationally recognized ANSI approved standard that would further help in disseminating and incorporating the approaches and technology of the prestandard into the mainstream of design and construction practices in the United States How successfully this volume achieves the second objective will become apparent with the passage of time as this prestandard goes through the balloting process of the American Society of Civil Engineers Several additional related efforts were ongoing during the development of this prestandard A concerted effort was made to gather any new information produced by these endeavors Topics varied considerably but typically covered approaches methodologies and criteria Whenever an analysis of the new information disclosed significant advances or improvements in the state of the practice they were included in this volume Thus maintaining FEMA 273 as a living document a process to which FEMA is strongly committed is continuing

Seismic Hazards: A Handbook Federal Emergency Agency, U. S. Department Security, 2013-04-03 This FEMA 154 Report Rapid Visual Screening of Buildings for Potential Seismic Hazards A Handbook is the first of a two volume publication on a recommended methodology for rapid visual screening of buildings for potential seismic hazards The technical basis for the methodology including the scoring system and its development are contained in the companion FEMA 155 report Rapid Visual Screening of Buildings for Potential Seismic Hazards Supporting Documentation The rapid visual screening procedure RVS has been developed for a broad audience including building officials and inspectors and government agency and private sector building owners to identify inventory and rank buildings that are potentially seismically hazardous Although RVS is applicable to all buildings its principal purpose is to identify 1 older buildings designed and constructed before the adoption of adequate seismic design and detailing requirements 2 buildings on soft or poor soils or 3 buildings having performance characteristics that negatively influence their seismic response Once identified as potentially hazardous such buildings should be further evaluated by a design professional experienced in seismic design to determine if in fact they are seismically hazardous The RVS uses a methodology based on a sidewalk survey of a building and a Data Collection Form which the person conducting the survey hereafter referred to as the screener completes based on visual observation of the building from the exterior and if possible the interior The Data Collection Form includes space for documenting building identification information including its use and size a photograph of the building sketches and documentation of pertinent data related to seismic performance including the development of a numeric seismic hazard score Once the decision to conduct rapid visual screening for a community or group of buildings has been made by the RVS authority the screening effort can be expedited by pre planning including the training of screeners and careful overall management of the process Completion of the Data Collection Form in the field begins with identifying the primary structural lateral load resisting system and structural materials of the building Basic Structural Hazard Scores for various building types are provided on the form and the screener circles the appropriate one For many buildings viewed only from the exterior this important decision requires the screener to be trained and experienced in building construction The procedure presented in this Handbook is meant to be the preliminary screening phase of a multi phase procedure for identifying potentially hazardous buildings Buildings identified by this procedure must be analyzed in more detail by an experienced seismic design professional Because rapid visual screening is designed to be performed from the street with interior inspection not always possible hazardous details will not always be visible and seismically hazardous buildings may not be identified as such Conversely buildings initially identified as potentially hazardous by RVS may prove to be adequate
