Shape From Shading:

Shape from Shading Berthold Horn,1971 A General Algorithm for Shape from Shading John Oliensis,Paul Dupuis,1992 *Shape Perception in Human and Computer Vision* Sven J. Dickinson,Zygmunt Pizlo,2013-06-29 This comprehensive and authoritative text reference presents a unique multidisciplinary perspective on Shape Perception in Human and Computer Vision Rather than focusing purely on the state of the art the book provides viewpoints from world class researchers reflecting broadly on the issues that have shaped the field Drawing upon many years of experience each contributor discusses the trends followed and the progress made in addition to identifying the major challenges that still lie ahead Topics and features examines each topic from a range of viewpoints rather than promoting a specific paradigm discusses topics on contours shape hierarchies shape grammars shape priors and 3D shape inference reviews issues relating to surfaces invariants parts multiple views learning simplicity shape constancy and shape illusions addresses concepts from the historically separate disciplines of computer vision and human vision using the same language and methods A Simple Algorithm for Shape from Shading M. Bichsel,Alexander Pentland,Massachusetts Institute of Technology. Media Laboratory. Vision and Modeling Group,1992 Adaptive Shape from Shading Atilla Gültekin,1997 Shape recovery is a classic problem in computer vision The goal in shape recovery is to extract surface orientation and surface depth from one or more images Shape from shading SFS deals with the recovery of 3 Dimensional shape from a single shaded image Shape from photometric stereo is another method for shape recovery used in computer vision In this technique shape is recovered by using multiple input images of the same scene generated fixed viewing direction and different light source directions The shape from shading problem is addressed in this study All the constraints used in SFS are combined in an iterative scheme and the effects of these constraints on the solution are explored Then a shape from shading algorithm based on the regularization theory is developed in which the smoothness is controlled spatially over the image space The spatial control of the smoothness is achieved by employing additional knowledge about the difference between the image which is obtained from the regularized solution and the input image The adaptive nature of the algorithm eliminates the selection of the optimum value of the smoothness parameter Using calculus of variations and a linear approximation of the reflectance map the new adaptive iterative scheme is developed The new algorithm is robust data driven and updates both the gradient field and height maps simultaneously A hierarchical implementation of our adaptive SFS algorithm is also presented In order to improve the quality of the reconstruction obtained by the SFS algorithm we integrated our adaptive SFS approach and photometric stereo technique to recover shape by using more than one input image **Shape from Shading** Curt L. Orbert,1988 Advances in Photometric 3D-Reconstruction Jean-Denis Durou,Maurizio Falcone,Yvain Quéau,Silvia Tozza,2020-09-16 This book presents the latest advances in photometric 3D reconstruction It provides the reader with an overview of the state of the art in the field and of the latest research into both the theoretical foundations of photometric 3D

reconstruction and its practical application in several fields including security medicine cultural heritage and archiving and engineering These techniques play a crucial role within such emerging technologies as 3D printing since they permit the direct conversion of an image into a solid object The book covers both theoretical analysis and real world applications highlighting the importance of deepening interdisciplinary skills and as such will be of interest to both academic researchers and practitioners from the computer vision and mathematical 3D modeling communities as well as engineers involved in 3D printing No prior background is required beyond a general knowledge of classical computer vision models numerical methods for optimization and partial differential equations

Direct Method for Reconstructing Shape from Shading

John Oliensis, Paul Dupuis, 1992 *Perspectives in Shape Analysis* Michael Breuß, Alfred Bruckstein, Petros Maragos, Stefanie Wuhrer, 2016-09-30 This book presents recent advances in the field of shape analysis Written by experts in the fields of continuous scale shape analysis discrete shape analysis and sparsity and numerical computing who hail from different communities it provides a unique view of the topic from a broad range of perspectives Over the last decade it has become increasingly affordable to digitize shape information at high resolution Yet analyzing and processing this data remains challenging because of the large amount of data involved and because modern applications such as human computer interaction require real time processing Meeting these challenges requires interdisciplinary approaches that combine concepts from a variety of research areas including numerical computing differential geometry deformable shape modeling sparse data representation and machine learning On the algorithmic side many shape analysis tasks are modeled using partial differential equations which can be solved using tools from the field of numerical computing The fields of differential geometry and deformable shape modeling have recently begun to influence shape analysis methods Furthermore tools from the field of sparse representations which aim to describe input data using a compressible representation with respect to a set of carefully selected basic elements have the potential to significantly reduce the amount of data that needs to be processed in shape analysis tasks The related field of machine learning offers similar potential The goal of the Dagstuhl Seminar on New Perspectives in Shape Analysis held in February 2014 was to address these challenges with the help of the latest tools related to geometric algorithmic and numerical concepts and to bring together researchers at the forefront of shape analysis who can work together to identify open problems and novel solutions The book resulting from this seminar will appeal to researchers in the field of shape analysis image and vision from those who want to become more familiar with the field to experts interested in learning about the latest advances

Neuromathematics of Vision Giovanna Citti, Alessandro Sarti, 2014-02-08 This book is devoted to the study of the functional architecture of the visual cortex Its geometrical structure is the differential geometry of the connectivity between neural cells This connectivity is building and shaping the hidden brain structures underlying visual perception The story of the problem runs over the last 30 years since the discovery of Hubel and Wiesel of the modular structure of the primary visual cortex and slowly came towards a theoretical understanding of the experimental data on what we now know as functional architecture of the primary visual cortex Experimental data comes from several domains neurophysiology phenomenology of perception and neurocognitive imaging Imaging techniques like functional MRI and diffusion tensor MRI allow to deepen the study of cortical structures Due to this variety of experimental data neuromathematics deals with modelling both cortical structures and perceptual spaces From the mathematical point of view neuromathematics call for new instruments of pure mathematics sub Riemannian geometry models horizontal connectivity harmonic analysis in non commutative groups allows to understand pinwheels structure as well as non linear dimensionality reduction is at the base of many neural morphologies and possibly of the emergence of perceptual units But at the center of the neurogeometry is the problem of harmonizing contemporary mathematical instruments with neurophysiological findings and phenomenological experiments in an unitary science of vision The contributions to this book come from the very founders of the discipline

Shape from Shading: An Assessment, 1983 The authors review previous efforts to recover surface shape from image irradiance to assess what can and cannot be accomplished They consider the informational requirements and restrictions of these approaches In dealing with the question of what surface parameters can be recovered locally from image shading they show that at most shading determines relative surface curvature i.e. the ratio of surface curvature measured in orthogonal image directions The relationship between relative surface curvature and the second derivatives of image irradiance is independent of other scene parameters but insufficient to determine surface shape This result places in perspective the difficulty encountered in previous attempts to recover surface orientation from image shading The various approaches reviewed in this paper have attempted to recover surface orientation from shading To do so they have added extra information such as known boundary conditions or constraints upon surface shape The performance of these various models allows the authors to draw the following conclusions 1 Direct integration of differential models of scene properties requires much a priori information and has to contend with major computational problems 2 Local computation must play a major role in the recovery of scene parameters but the models used have been overly restrictive in an effort to

recover particular information and 3 A relaxation mechanism based on a strong low order differential model seems a viable means of propagating spatial information and constraints Shading provides a basis for an intrinsic image specifying relative surface curvature and curvature change but this intrinsic image alone is insufficient for surface shape recovery Other models incorporating other image measurements are needed to complement shading Such models should utilize the advantages of local computation

The Use of the Hough Transform in Shape-from-shading Peter Kort, 2007 Shape from shading is a challenging problem in the field of computer vision The goal is to detect the three dimensional shape of an object when given an image of that object The relationship between the shading information and the orientation of the object's surface known as the reflectance function is used to perform this computation
