Shapes Loops Images:

Multiresolution Image Shape Description John M. Gauch, 2012-12-06 Much of our understanding of the relationships among geometric structures in images is based on the shape of these structures and their relative orientations positions and sizes Thus developing quantitative methods for capturing shape information from digital images is an important area for computer vision research This book describes the theory implementation and application of two multi resolution image shape description methods The author begins by motivating the need for quantitative methods for describing both the spatial and intensity variations of structures in grey scale images Two new methods which capture this information are then developed The first the intensity axis of symmetry is a collection of branching and bending surfaces which correspond to the skeleton of the image The second method multiresolution vertex curves focuses on surface curvature properties as the image is blurred by a sequence of Gaussian filters Implementation techniques for these image shape descriptions are described in detail Surface functionals are minimized subject to symmetry constraints to obtain the intensity axis of symmetry Robust numerical methods are developed for calculating and following vertex curves through scale space Finally the author demonstrates how grey scale images can be segmented into geometrically coherent regions using these shape description techniques Building quantitative analysis applications in terms of these visually sensible image regions promises to be an exciting area of biomedical computer vision research v Acknowledgments This book is a corrected and revised version of the author's Ph D

Solar Image Analysis and Visualization Jack Ireland, C. Alex Young, 2009-08-27 The SECCHI A and B instrument suites Howard et al 2006 onboard the two STEREO mission spacecraft Kaiser 2005 are each composed of one Extreme Ultra Violet Imager EUVI two white light coronagraphs COR1 and COR2 and two wide angle heliospheric imagers HI1 and HI2 Technical descriptions of EUVI COR1 and the HIs can be found in Wuelser et al 2004 Thompson et al 2003 and Deise et al 2003 respectively The images produced by SECCHI represent a data visualization challenge i the images are 2048 2048 pixels except for the HIs which are usually binned onboard 2 2 thus the vast majority of computer displays are not able to display them at full frame and full resolution and ii more importantly the ve instruments of SECCHI A and B were designed to be able to track Coronal Mass Ejections from their onset with EUVI to their propagation in the heliosphere with the HIs which implies that a set of SECCHI images that covers the propagation of a CME from its initiation site to the Earth is composed of images with very different spatial resolutions from 1.7 arcseconds/pixel for EUVI to 2.15 1 arcminutes/pixel for HI2 i.e 75 times larger A similar situation exists with the angular scales of the physical objects since the size of a CME varies by orders of magnitude as it expands in the heliosphere

Methods for Appearance-based Loop Closure Detection Emilio Garcia-Fidalgo,Alberto Ortiz,2018-03-14 Mapping and localization are two essential tasks in autonomous mobile robotics Due to the unavoidable noise that sensors present mapping algorithms usually rely on loop closure detection techniques which entail the correct identification of previously seen places to reduce the uncertainty of the resulting maps This book deals with the problem of generating topological maps

of the environment using efficient appearance based loop closure detection techniques Since the quality of a visual loop closure detection algorithm is related to the image description method and its ability to index previously seen images several methods for loop closure detection adopting different approaches are developed and assessed Then these methods are used in three novel topological mapping algorithms The results obtained indicate that the solutions proposed attain a better performance than several state of the art approaches To conclude given that loop closure detection is also a key component in other research areas a multi threaded image mosaicing algorithm is proposed This approach makes use of one of the loop closure detection techniques previously introduced in order to find overlapping pairs between images and finally obtain seamless mosaics of different environments in a reasonable amount of time

The Shape of Algebra in the Mirrors of Mathematics Gabriel Katz,Vladimir Nodelman,2012 The Shape of Algebra is the authors attempt to share their mathematical experiences with readers who have more than a passing interest in mathematics but have only a traditional exposure to elementary algebra Secondary school and college teachers and students who want to expand their horizons in the field will find a fresh presentation of familiar concepts and some unexpected results This book serves as a text for an appreciation course in modern mathematics designed for non mathematics majors or for first year students who are considering the possibility of studying mathematics or related disciplines It can also serve as a source of computer supported activities that could supplement traditional courses in algebra multivariable calculus and complex variable This book gives the reader a sense of the visual nature of mathematics Mathematical experiments with universal mapping software VisuMatica designed by Vladimir Nodel man form the very core of the book Readers are encouraged to reproduce play with and expand on these experiments Numerous problems are interspersed throughout the text to guide the reader Our treatment of standard algebra is visual and computational By introducing visual computational environments like VisuMatica our book promotes this geometric approach to algebra and makes it accessible to readers a great deal earlier The book will enable our readers to approach its content on three levels the first one which requires only some fluency with elementary algebraic manipulations the second one which also presumes familiarity with the notions of derivatives and tangent lines to plane curves and the third one which uses some basic concepts of multivariable calculus All three levels are clearly marked in the text and will allow for a smooth reading and virtual experiments regardless of the level that our readers will find comfortable

Image Operators Jason M. Kinser,2018-10-10 For decades researchers have been developing algorithms to manipulate and analyze images From this a common set of image tools now appear in many high level programming languages Consequently the amount of coding required by a user has significantly lessened over the years While the libraries for image analysis are coalescing to a common toolkit the language of image analysis has remained stagnant Often textual descriptions of an analytical protocol consume far more real estate than does the computer code required to execute the processes Furthermore the textual explanations are sometimes vague or incomplete This book offers a precise mathematical language

Computational Geometry, Topology and Physics of Digital Images with Applications James F. Peters,2019-10-03 This book discusses the computational geometry topology and physics of digital images and video frame sequences This trio of computational approaches encompasses the study of shape complexes optical vortex nerves and proximities embedded in triangulated video frames and single images while computational geometry focuses on the geometric structures that infuse triangulated visual scenes The book first addresses the topology of cellular complexes to provide a basis for an introductory study of the computational topology of visual scenes exploring the fabric shapes and structures typically found in visual scenes The book then examines the inherent geometry and topology of visual

scenes and the fine structure of light and light caustics of visual scenes which bring into play catastrophe theory and the appearance of light caustic folds and cusps Following on from this the book introduces optical vortex nerves in triangulated digital images In this context computational physics is synonymous with the study of the fine structure of light choreographed in video frames This choreography appears as a sequence of snapshots of light reflected and refracted from surface shapes providing a solid foundation for detecting analyzing and classifying visual scene shapes
