

THE GROBIN DAVIS SITE: ARCHAEOGEOPHYSICS AND SETTLEMENT PATTERNS AT CADDO MOUND CENTERS IN SOUTHEASTERN OKLAHOMA

Amanda L. Regnier,¹
Scott W. Hammerstedt,²
and Nicholas H. Beale³

The Grobin Davis site (35MC254) is the best-preserved Caddo prehistoric Caddo mound site in southeastern Oklahoma. For 100 years, located along the Little River, remains of seven mounds arranged in a horseshoe configuration. Archaeological investigations of the site have been limited to a series of profile tests and three 1 x 1 m units. Between November 2011 and February 2012, the Oklahoma Archeological Survey conducted geophysical survey of the bulk of the site, covering approximately 32,000 m² with a Flanagan gradiometer. This study provides important information about Caddo mound construction, settlement, and interaction in southeastern Oklahoma and adds to a growing body of knowledge on prehistoric Caddo complexity patterns.

The Grobin Davis (35MC254) mound complex is one of the largest and certainly the best-preserved Caddo mound site in eastern Oklahoma (Figure 1). The site is made up of seven mounds arranged in a horseshoe shape on a terrace of the Little River (Figure 2). Unlike many contemporaneous mound sites in the region, it has never been heavily plowed, has not been the focus of substantial archaeological excavations, and has remained largely unexplored by a team of professional. While historic and professional archaeologists alike have been active in the region for well over a century, the site remained unexcavated by either group until the late 1970s. Since the site was revealed, the only professional investigations consisted of limited visibility testing in 1988 by a crew from the Oklahoma Archeological Survey. After the testing, the Archaeological Conservancy purchased the site and no further archaeological work has been undertaken. The initial testing confirmed the seven earthen mounds were numerous features, established rough corners as dated A.D. 1200, 1400, and indicated the presence of a possible sheet midden in areas of the

site. Given the limited extent of the excavations, numerous questions remain about the role of Grobin Davis in the daily and ritual lives of the prehistoric Caddo of the Little River drainage. Did the site have any seasonal year-round occupation or was it a variant ceremonial center with a small resident population of religious specialists? How did each of the seven mounds of the site fit into the broader categories of mounds constructed by the prehistoric Caddo? Was the horseshoe configuration of mounds part of a larger site plan that incorporated a plaza area and residential buildings?

Between November 2011 and February 2012, we conducted a geophysical survey of approximately 32,000 m² of the 12 ha site (see Figure 2). In recent years, archaeological geophysics has moved beyond a simple prospecting tool and can be used to generate information on a site-wide scale, including site plans and broader images of landscape orientation (Kvamme 2000). Understanding the site plan will also allow us to consider the ways in which the site was integrated into the regional ritual landscape, as part of the broader application of geophysical research (Hammerstedt et al. 2011). This article presents the results of the survey and summarizes prior excavations in order to better understand the role of Grobin Davis in the political and religious landscape of the prehistoric Caddo of south-eastern Oklahoma and the larger Caddo region as a whole as part of an ongoing regional research effort (Dowd 2011, 2012; Hammerstedt et al. 2011; Regnier 2012, 2012; Regnier and Dowd 2012; Regnier et al. 2013).

Site Background

Prehistoric Archaeological Investigations

The Grobin Davis mounds are at the confluence of the Little River and White Oak Creek in the rolling piedmont territory between the Coastal Plain of the Red River and the southern extent of the Ouachita Mountains. The Little River originates in the Ouachita Mountains, where it flows west, turns south, and finally turns southeast, paralleling the Red River,
