Buller, 1967 Fall migrating sandhill cranes arrived at congregation sites in southern Canada and in the States of the Central Flyway between late July and early October Sandhills peaked at about 100 000 birds at way stations during the fall of 1964 Footprint measurements indicated that the lesser sandhill was by far the most numerous subspecies at way stations in Montana North Dakota South Dakota and Colorado These measurements also indicated that flocks stopping over in Wyoming Kansas and Oklahoma contained a significant number of Canadian sandhill or greater sandhill or both A selective collecting program indicated that the footprint measurement technique overemphasized the incidence of the greater sandhill at way stations in North Dakota and South Dakota Whooping cranes and sandhills were occasionally observed together during the early part of the fall migration At times fall migrating sandhills fed on standing and harvested grain crops in Canada and the States of the Central Flyway but seldom were depredations considered serious **Summary of Federal**
