Edition details the impact of computers data processing and telecommunications on building system design the effects of new
stringent energy codes on building systems and computer calculation techniques as applied to daylighting and electric

lighting design As did earlier editions the book provides the basic theory and design guidelines for both systems and equipment in everything from heating and cooling water and waste fire and fire protection systems lighting and electrical wiring plumbing elevators and escalators acoustics and more Thoroughly illustrated the book is a basic primer on making comfort and resource efficiency integral to the design standard 1991 0 471 52502 2 1 664 pp **Standards, Zinc-coated (galvanized) Sheet Steel for Structural Building Products** Canadian Sheet Steel Building Institute,1968 **Sheet Steel in Building** Iron and Steel Institute,1973 *Rapid Visual Screening of Buildings for Potential Seismic Hazards* Applied Technology Council,1988 **Rapid Visual Screening of Buildings for Potential Seismic Hazards: A Handbook** Federal Emergency Agency,U. S. Department Security,2013-04-03 This FEMA 154 Report Rapid Visual Screening of Buildings for Potential Seismic Hazards A Handbook is the first of a two volume publication on a recommended methodology for rapid visual screening of buildings for potential seismic hazards The technical basis for the methodology including the scoring system and its development are contained in the companion FEMA 155 report Rapid Visual Screening of Buildings for Potential Seismic Hazards Supporting Documentation The rapid visual screening procedure RVS has been developed for a broad audience including building officials and inspectors and government agency and private sector building owners to identify inventory and rank buildings that are potentially seismically hazardous Although RVS is applicable to all buildings its principal purpose is to identify 1 older buildings designed and constructed before the adoption of adequate seismic design and detailing requirements 2 buildings on soft or poor soils or 3 buildings having performance characteristics that negatively influence their seismic response Once identified as potentially hazardous such buildings should be further evaluated by a design professional experienced in seismic design to determine if in fact they are seismically hazardous The RVS uses a methodology based on a sidewalk survey of a building and a Data Collection Form which the person conducting the survey hereafter referred to as the screener completes based on visual observation of the building from the exterior and if possible the interior The Data Collection Form includes space for documenting building identification information including its use and size a photograph of the building sketches and documentation of pertinent data related to seismic performance including the development of a numeric seismic hazard score Once the decision to conduct rapid visual screening for a community or group of buildings has been made by the RVS authority the screening effort can be expedited by pre planning including the training of screeners and careful overall management of the process Completion of the Data Collection Form in the field begins with identifying the primary structural lateral load resisting system and structural materials of the building Basic Structural Hazard Scores for various building types are provided on the form and the screener circles the appropriate one For many buildings viewed only from the exterior this important decision requires the screener to be trained and experienced in building construction The procedure presented in this Handbook is meant to be the preliminary screening phase of a multi phase procedure for identifying potentially hazardous buildings Buildings identified by

this procedure must be analyzed in more detail by an experienced seismic design professional Because rapid visual screening is designed to be performed from the street with interior inspection not always possible hazardous details will not always be visible and seismically hazardous buildings may not be identified as such Conversely buildings initially identified as potentially hazardous by RVS may prove to be adequate
