**The Behavior of Shells Composed of Isotropic and Composite Materials** Jack R. Vinson, 2013-04-17 Shell structures are used in all phases of structures from space vehicles to deep submergence hulls from nuclear reactors to domes on sport arenas and civic buildings With new materials and manufacturing methods curved thin walled structures are being used increasingly This text is a graduate course in the theory of shells It covers shells of isotropic materials such as metal alloys and plastics and shells of composite materials such as fibre reinforced polymer metal or ceramic matrix materials It provides the essential information for an understanding of the underlying theory and solution of some of the basic problems It also provides a basis to study the voluminous shell literature Beyond being primarily a textbook it is intended also for self study by practising engineers who would like to learn more about the behaviour of shells The book has two parts Part I deals with shells of isotropic materials In this part the mathematical formulations are introduced involving curvilinear coordinates The techniques of solutions and resulting behavior is compared to planar thin walled isotropic structures such as plates and beams Part II then treats the behavior of shells involving anisotropic composite materials so widely used today The analysis involves the complications due to the many elastic constants effects of transverse shear deformation thermal thickening and offer effects arising from the properties of composite materials

*Advances in the Mechanics of Plates and Shells* D. Durban, Dan Givoli, J.G. Simmonds, 2006-04-11 The optimal control of flexible structures is an active area of research The main body of work in this area is concerned with the control of time dependent displacements and stresses and assumes linear elastic conditions namely linear elastic material behavior and small deformation See e.g. 1-3 the collections of papers 4-5 and references therein On the other hand in the present paper we consider the static optimal control of a structure made of a nonlinear elastic material and undergoing large deformation An important application is the suppression of static or quasi static elastic deformation in flexible space structures such as parts of satellites by the use of control loads 6 Solar radiation and radiation from other sources induce a temperature field in the structure which in turn generates an elastic displacement field The displacements must usually satisfy certain limitations dictated by the allowed working conditions of various orientation sensitive instruments and antennas in the space vehicle For example a parabolic reflector may cease to be effective when undergoing large deflection The elastic deformation can be reduced by use of control loads which may be imp
