

Pathogenic Bacteria

(the **bad** bacteria that make people sick)

Early in the 1900's, scientists discovered that many common diseases are caused by bacteria. Robert Koch discovered that a bacteria called *Bacillus anthracis* causes Anthrax, and *Mycobacterium tuberculosis* causes Tuberculosis. Soon after, the bacterial cause of many diseases was discovered. It is important to note that only some species of bacteria cause disease. We are surrounded by a countless number of bacteria in the dirt, ocean and even in our bodies that are totally harmless.

The petri plate to the right has millions of cells of *S. aureus* growing on it. This bacteria causes serious skin infections and is known to be resistant to many common antibiotics.*

Bacteria are too small to be seen without a microscope. They are about 1,000 times smaller than a tiny grain of sand (or 1 micrometer in diameter). They are however visible using a light microscope at 1,000x magnification. The image above is a photo of *Corynebacterium glutamicum*, stained with a purple dye and viewed at 1,000x. It is a close relative of the bacteria that causes Diphtheria.

Some pathogenic bacteria, like *Clostridium tetani* and *Bacillus anthracis* can produce structures called spores that are very resistant to harsh conditions. They are called endospores when located in the center of the cell, and can be seen as the bright centers of the image above.

1,000x is the limit of magnification possible with a light microscope without losing resolution, due to the wavelength of light. You can of course continue magnifying the image (like the spore shown above)- you however do not get any better resolution (or ability to discriminate between two close points). Microscopes exist that use electrons instead of light (Electron Microscopes) that can produce images at much higher magnification with great resolution. Below is an image of a close relative of *Vibrio cholerae* produced with a Scanning Electron Microscope (SEM).

* The red petri plate above is red because of blood that is added to the media. A clearing of the color can be seen around the growth of *S. aureus*. This occurs because some pathogenic bacteria produce hemolysins which are capable of lysing (or breaking down) red blood cells. *S. aureus* is a growing health threat due to the emergence of strains resistant to antibiotics- MRSA (Methicillin Resistant *Staphylococcus aureus*) and VRSA (Vancomycin Resistant *Staphylococcus aureus*).

the Bacteria	the Disease
<i>Mycobacterium tuberculosis</i>	Tuberculosis
<i>Yersinia pestis</i>	Plague

The list above includes pathogenic bacteria and diseases they cause. It is not complete, but includes many common bacterial diseases.

Artificial Intelligence in Pathogenic Microorganism Research Chen Li, Yu-Dong Yao, Marcin Grzegorzec, 2025-05-26 Infections caused by pathogenic microorganisms including bacteria viruses fungi and other eukaryotic microbes seriously threaten human health Traditional research methods and laboratory techniques have many limitations and focus more on the identification and classification of pathogenic microorganisms In recent years technologies such as whole genome sequencing and advanced bioinformatics analysis have promoted the research of pathogenic microorganisms However with the interplay of multiple factors like global climate change ecological and environmental changes urbanization social behavior and lifestyle changes pathogenic microorganisms transmission patterns and impact scope are gradually changing There is an urgent need for multidimensional technological approaches to achieve epidemiological monitoring and evolutionary direction prediction of pathogenic microorganisms Additionally more robust data processing and analysis capabilities are required for rapid identification and diagnosis monitoring of drug resistance development of antimicrobial drugs and vaccines and optimization of treatment plans Therefore Artificial Intelligence AI has entered our field of vision In the field of pathogenic microorganisms AI has shown tremendous potential In epidemiological research AI technology can quickly and automatically collect integrate and analyze the epidemic data of infectious diseases from different regions so as to predict the trend and scope of disease transmission and track the source of infection In the process of diagnosis and treatment of infectious diseases machine learning can not only analyze the microscopic images of pathogens but also analyze the genome sequences of multiple pathogens in a short time and predict their sensitivity or resistance to specific antibiotics greatly improving the efficiency and accuracy of diagnosis and treatment of infectious diseases In drug or vaccine development researchers can use AI models to predict efficient antigens for diseases such as HIV and influenza and thus design more effective vaccine candidates AI models can also analyze the interactions between drugs pathogens and patients in order to design the optimal dosing regimen for each patient In a word AI can help human beings better deal with

infectious diseases We welcome original reviews articles and other contributions in related fields which mainly include the following aspects 1 The application of AI in the differential diagnosis of pathogenic microorganisms 2 The application of AI in the formulation of anti infection treatment plans 3 The application of AI in monitoring and predicting the prevalence of pathogenic microorganisms 4 Application of AI in the prediction and prevention of infectious diseases caused by pathogenic microorganisms 5 The application of AI in the research and development of anti infective drugs and vaccines
