Quantifiers: Logics, Models and Computation Michal Krynicki, M. Mostowski, L.W. Szerba, 2013-04-09 This volume contains a collection of research papers centered around the concept of quantifier Recently this concept has become the central point of research in logic It is one of the important logical concepts whose exact domain and applications have so far been insufficiently explored especially in the area of inferential and semantic properties of languages It should thus remain the central point of research in the future Moreover during the last twenty years generalized quantifiers and logical technics based on them have proved their utility in various applications The example of natural language semantics has been particularly striking For a long time it has been believed that elementary logic also called first order logic was an adequate theory of logical forms of natural language sentences Recently it has been accepted that semantics of many natural language constructions can not be properly represented in elementary logic It has turned out however that they can be described by means of generalized quantifiers As far as computational applications of logic are concerned particularly interesting are semantics restricted to finite models Under this restriction elementary logic loses several of its advantages such as axiomatizability and compactness And for various purposes we can use equally well some semantically richer languages of which generalized quantifiers offer the most universal methods of describing extensions of elementary logic Moreover we can look at generalized quantifiers as an explication of some specific mathematical concepts e.g. *In the Shadow of Descartes* G.H. Von Wright, 2013-03-09 Descartes made a sharp distinction between matter and mind But he also thought that the two interact with one another Is such interaction possible however without either a materialist reduction of mind to matter or an idealist phenomenalist reduction of matter to mind These questions overshadow the Western tradition in metaphysics from the time of Descartes to present times The book makes an effort to stay clear of reductivist views of the two Cartesian substances It defends a dualistic psycho physical parallel theory which reconciles freedom of action with determinism in nature Basic problems in perception theory are also discussed with special emphasis on hearing and sound Because of the

intrinsic interest of the subject and the author's non technical presentation of it the book should appeal to all readers with a serious interest in philosophy and psychology

Exogenous Factors in Colonic Carcinogenesis W. Scheppach, M. Scheurlen, 2003-01-31 This book is the proceedings of Falk Symposium 128 held in Würzburg Germany on May 2-3 2002 and dedicated to the important issue of colonic carcinogenesis and its underlying genetic and environmental factors Colorectal cancer is one of the leading causes of cancer related death in industrialized countries It has been recognized to be the consequence of a dynamic process leading from hyperproliferative epithelium through different classes of adenomas to invasive carcinoma This adenoma carcinoma sequence has been characterized on a molecular basis Modern molecular biology has also helped to clarify the clustering of colorectal cancer within families a phenomenon that has been known to clinicians for a long time Thus the pathogenesis of the two distinct familial colon cancer syndromes FAP familial adenomatous polyposis and HNPCC hereditary non polyposis colorectal cancer is increasingly being understood Thereby an identification of affected people has become possible before the disease has manifested There is also convincing evidence that the pathogenesis of sporadic colonic cancer is modulated by environmental mainly nutritional factors Carcinogens seem to be far less important than the components of the normal human diet It is likely that the interplay between protective and noxious dietary compounds determines the progression of the adenoma carcinoma sequence Additionally a broad spectrum of drugs has been shown to affect colonic tumorigenesis which provides the rationale for chemoprevention strategies These issues set the scene for discussions on how genetic and environmental factors may interact in the pathogenesis of colonic cancer contributing fresh ideas to the prevention of this most prevalent malignancy in the industrialized world

Philosophical Lectures on Probability Bruno de Finetti, 2008-05-20 Bruno de Finetti 1906-1985 is the founder of the subjective interpretation of probability together with the British philosopher Frank Plumpton Ramsey His related notion of exchangeability revolutionized the statistical methodology This book based on a course held in 1979 explains in a language accessible also to non mathematicians the fundamental tenets and implications of subjectivism according to which the probability of any well specified fact F refers to the degree of belief actually held by someone on the ground of her whole knowledge on the truth of the assertion that F obtains

In Search of a New Humanism M.R. Egidi, 2013-04-17 This collection of essays presents a systematic and up to date survey of the main aspects of Georg Henrik von Wright's philosophy tracing the general humanistic leitmotiv to be found in his vast varied output The analysis covers the developments in Von Wright's thought up to the end of the 1990s The essays are arranged thematically to focus on the chief areas of Von Wright's interests practical rationality human action and determinism philosophical logic and theories of norms research in the analytical tradition and Wittgenstein studies Readership Scholars and students of moral philosophy logic psychology sociology cognitive science and the history of contemporary philosophy

Language, Quantum, Music Maria Luisa Dalla Chiara, Roberto Giuntini, Federico Laudisa, 2013-04-17 A vivid and comprehensive picture of the current state of research in

all directions of logic and philosophy of science The book presents a wide combination of papers containing relevant technical results in the foundations of science and papers devoted to conceptual analyses deeply rooted in advanced present day research Audience The volume is attractive both for specialists in foundational questions and scholars interested in general epistemology

Signs of Logic Ahti-Veikko Pietarinen, 2006-08-25 Charles Sanders Peirce 1839 1914 the principal subject of this book was one of the most profound and prolific thinkers and scientists to have come out of the United States His pragmatic logic and scientific methodology largely represent the application of interactive and intercommunicative triadic processes best viewed as strategic and dialogic conceptualisations of logical aspects of thought reasoning and action These viewpoints also involve pragmatic issues in communicating linguistic signs and are unified in his diagrammatic logic of existential graphs The various game theoretic approaches to the semantics and pragmatics of signs and language to the theory of communication and to the evolutionary emergence of signs provide a contemporary toolkit the relevance of which Peirce envisioned to a wondrous extent This work sheds considerable new light on these and other aspects of Peirce s philosophy and his pragmatic theory of meaning Many of his most significant writings in this context reflect his later thinking covering roughly the last 15 20 years of his life and they are still unpublished Drawing comprehensively from his unpublished manuscripts the book offers a fresh and rich picture of this remarkable man s original involvement with logical aspects of thought in action

Intensionality and Truth Philip Hugly, C. Sayward, 2012-12-06 Prior s view on intensionality and truth is based on the principle that sentences never name that what sentences say cannot be otherwise signified that a sentence says what it says whatever the type of its occurrence and that sentential quantification is neither eliminable substitutional nor referential The text defends each of these principles

The Dynamics of Thought Peter Gardenfors, 2005-07 This volume is a collection of some of the most important philosophical papers by Peter G rdenfors Spanning a period of more than 20 years of his research they cover a wide ground of topics from early works on decision theory belief revision and nonmonotonic logic to more recent work on conceptual spaces inductive reasoning semantics and the evolutions of thinking Many of the papers have only been published in places that are difficult to access The common theme of all the papers is the dynamics of thought Several of the papers have become minor classics and the volume bears witness of the wide scope of G rdenfors research and of his crisp and often witty style of writing The volume will be of interest to researchers in philosophy and other cognitive sciences

Defeasible Deontic Logic Donald Nute, 2012-12-06 Relevant to philosophy law management and artificial intelligence these papers explore the applicability of nonmonotonic or defeasible logic to normative reasoning The resulting systems purport to solve well known deontic paradoxes and to provide a better treatment than classical deontic logic does of prima facie obligation conditional obligation and priorities of normative principles

Logic, Meaning and Computation C. Anthony Anderson, Michael Zelény, 2012-12-06 This volume began as a remembrance of Alonzo Church while he was still with us and is now finally complete It contains papers by many well known

scholars most of whom have been directly influenced by Church's own work. Often the emphasis is on foundational issues in logic, mathematics, computation and philosophy as was the case with Church's contributions now universally recognized as having been of profound fundamental significance in those areas. The volume will be of interest to logicians, computer scientists, philosophers and linguists. The contributions concern classical first order logic, higher order logic, non-classical theories of implication, set theories with universal sets, the logical and semantical paradoxes, the lambda calculus especially as it is used in computation, philosophical issues about meaning and ontology in the abstract sciences and in natural language and much else. The material will be accessible to specialists in these areas and to advanced graduate students in the respective fields.

Denying Existence A. Chakrabarti, 2013-03-14 This book tries to explore in language as non-technical as possible the deepest philosophical problems regarding the logical status of empty singular terms such as Pegasus, Batman. The impossible staircase departs in Escher's painting Ascending/Descending etc. and regarding sentences which deny the existence of singled out fictional entities. It will be fascinating for literary theorists with a flair for logic, to students of metaphysics and philosophy of language and for historians of philosophy interested in the fate of the Russell/Meinong debate. For teachers of these aspects of analytic philosophy this will provide a textbook which goes beyond the Western tradition without plunging into any mystical Eastern Emptiness which is what some previous comparative philosophers did.

Explanation Giora Hon, Sam S. Rakover, 2013-04-17 For some years we have been conducting at the University of Haifa an interdisciplinary seminar on explanation in philosophy and psychology. We habitually begin the seminar with some philosophical reflections on explanation, an analysis of the concept and its metaphysical underpinnings. We discuss the various models and proceed to examine explanation in the setting of psychology. Thus from the outset we have focused not only on the concept itself but also on its application. The objective that we have set for the seminar attended by students from both departments Philosophy and Psychology has been a critical understanding of the concept of explanation, its use and limitations. We were keen on deepening our understanding of the concept and on exploring its applications in fields of knowledge other than psychology. This was the motivation for convening an international conference on explanation and its application. The conference took place in the spring of 1998 under the auspices of the University of Haifa. The present book is the fruit of this meeting. The reader should note that the second part of the Introduction presents a detailed analytical account of the book. We hope that this overview will facilitate efficient use of the book by directing the reader's attention to those issues that might be of interest to him or her.

First-Order Modal Logic M. Fitting, Richard L. Mendelsohn, 1998 This is a thorough treatment of first order modal logic. The book covers such issues as quantification, equality including a treatment of Frege's morning star/evening star puzzle, the notion of existence, non-rigid constants and function symbols, predicate abstraction, the distinction between nonexistence and nondesignation and definite descriptions borrowing from both Fregean and Russellian paradigms.
