Plant Nutrition - Physiology and Applications M.L. Van Beusichem, 2012-12-06 Exactly 35 years after the first Colloquium was held the Eleventh International Plant Nutrition Colloquium took place from 30 July to 4 August 1989 in Wageningen The Netherlands Although impressive progress has been made during the past decades in our understanding of the mechanisms of uptake distribution and assimilation of nutrients in relation to crop yield and quality there are still significant gaps in our insight into many fundamental aspects of plant mineral nutrition and related metabolic processes In spite of improved knowledge of nutrient requirements of crops and improved fertilizer application strategies the world population remains to be burdened with an enormous shortage of plant products for food timber fuel shelter and other purposes The main challenge facing the plant nutrition research community is to at least alleviate the increasing world wide need for applying scientific knowledge to practical problems in agriculture horticulture and forestry It is therefore felt by many scientists that the Plant Nutrition Colloquia which are intended to bring together scientists and to integrate knowledge and approaches acquired in plant physiology biochemis try soil science agronomy and related disciplines have indeed made a significant contribution to the advancement of our knowledge and understanding in this vital and interdisciplinary field of agrobiolology About 260 scientists from 40 nations attended the Colloquium in Wageningen

Plant Nutrition Walter Horst, M.K. Schenk, A. Bürkert, N. Claassen, H. Flessa, W.B. Frommer, Heiner E. Goldbach, H.-W. Olfs, V. Römhild, B. Sattelmacher, U. Schmidhalter, S. Schubert, N. von Wirén, L. Wittenmayer, 2006-05-18 The world's population is expected to reach 8 billion by 2025 and most of this growth in population will occur in developing countries To feed the world with such a marked increase in population a great improvement in food production must be achieved particularly in these countries To meet this challenge present agricultural productivity must be increased on the

cultivated land However in many developing countries particularly in Africa reduced soil fertility caused by continuous cropping with low nutrient input and the resultant nutrient mining of soils is a major threat both to food production and to ecosystem viability As a result of declining soil fertility together with increasing population pressure expansion of crop production to marginal lands and forested areas contribute to the destruction of natural ecosystems Food production is not only a quantitative challenge Improving the nutrient status of plants provides a further valuable means of enhancing food quality and is of extreme benefit to the health of both plants and humans There are several excellent examples showing that plants with optimum nutrient status are better adapted to biotic and abiotic stress factors Because of population pressures many global food systems are not currently providing enough micronutrients to ensure adequate micronutrient intakes in the human diet This has resulted in an increasing prevalence of micronutrient deficiencies that now afflicts over three billion people worldwide
