Veterans Administration,1971 *Pathophysiology of the Basal Ganglia and Movement Disorders: Gaining New Insights from Modeling and Experimentation to Influence the Clinic* Daniela Andres,Olivier Darbin,Marcelo Merello,2017-10-31 The basal ganglia constitute a group of subcortical structures highly interconnected among themselves as well as with the cerebral cortex thalamus and other brain areas These nuclei play a central role in the control of voluntary movement and their specific pathology comprises the group of diseases known as movement disorders including Parkinson s disease Huntington s disease dystonia and Gilles de la Tourette syndrome among others Additionally the presence of a number of circuits within the basal ganglia related to non motor functions has been acknowledged Currently the basal ganglia are thought to participate in cognitive limbic and learning functions Moreover disorders related to the basal ganglia are known to involve a number of complex non motor symptoms and syndromes e g compulsive and addictive behavior In the light of this evidence it is becoming clear that our knowledge about the basal ganglia needs to be revised and that new pathophysiological models of movement disorders are needed In this context the study of the pathophysiology of the basal ganglia and the treatment of their pathology is becoming increasingly interdisciplinary Nowadays an appropriate approach to the study of these problems must necessarily involve the use of complex mathematical modeling computer simulations basic research ranging from biomolecular studies to animal experimentation and clinical research This research topic aims to bring together the most recent advances related to the pathophysiology of the basal ganglia and movement disorders National Library of

Regulation of Membrane Na⁺-K⁺ ATPase Sajal Chakraborti, Naranjan S Dhalla, 2015-12-16 Na K ATPase or Na pump ATPase a member of P type ATPase superfamily is characterized by association of multiple isoforms mainly of its α and β subunits At present four different α 1 2 3 and 4 and three β 1 2 and 3 isoforms have been identified in mammalian cells and their differential expressions are tissue specific Regulation of Na K ATPase activity is an important but a complex process which involves short term and long term mechanisms Short term regulation of Na K ATPase is either mediated by changes in intracellular Na concentrations that directly affect the Na pump activity or by phosphorylation dephosphorylation mediated by some stimulants leading to changes in its expression and transport properties On the other hand long term regulation of Na K ATPase is mediated by hormones such as mineralocorticoids and thyroid hormones which cause changes in the transcription of genes of α and β subunits leading to an increased expression in the level of Na pump Several studies have revealed a relatively new type of regulation that involves the association of small single span membrane proteins with this enzyme These proteins belong to the FXYD family the members of which share a common signature sequence encompassing the transmembrane domain adjacent to the α isoforms of subunits of Na K ATPase Considering the extraordinary importance of Na K ATPase in cellular function several internationally established investigators have contributed their articles in the monograph entitled Regulation of Membrane Na K ATPase for inspiring young scientists and graduate students to enrich their knowledge on the enzyme and we are sure that this book will soon be considered as a comprehensive scientific literature in the area of Na K ATPase regulation in health and disease
