Readings in Hardware/Software Co-Design Giovanni De Micheli, Rolf Ernst, Wayne Wolf, 2001-06-19 Embedded system designers are constantly looking for new tools and techniques to help satisfy the exploding demand for consumer information appliances and specialized industrial products One critical barrier to the timely release of embedded system products is integrating the design of the hardware and software systems Hardware software co design is a set of methodologies and techniques specifically created to support the concurrent design of both systems effectively reducing multiple iterations and major redesigns In addition to its critical role in the development of embedded systems many experts believe that co design will be a key design methodology for Systems on a Chip Readings in Hardware Software Co Design presents the papers that have shaped the hardware software co design field since its inception in the early 90s Field experts Giovanni De Micheli Rolf Ernst and Wayne Wolf introduce sections of the book and provide context for the paper that follow This collection provides professionals researchers and graduate students with a single reference source for this critical aspect of computing design Over 50 peer reviewed papers written from leading researchers and designers in the field Selected edited and introduced by three of the fields most eminent researchers and educators Accompanied by an annually updated companion Web site with links and references to recently published papers providing a forum for the editors to comment on how recent work continues or breaks with previous work in the field      **Asian Test Symposium** ,1992      **Euro-Par 2007 Parallel**

traditionally viewed as the major language pathway for repetition but scientists also envisioned that white matter tracts travelling through the insular cortex ventral stream and transcortical connections may take part in language processing Modern cognitive neuroscience has provided tools including neuroimaging which allow the in vivo examination of short and long distance white matter pathways binding cortical areas essential for verbal repetition However this state of the art on the neural correlates of language repetition has revealed contradictory findings with some researchers defending the role of the dorsal and ventral streams whereas others argue that only cortical hubs Sylvian parieto temporal cortex Spt are crucially relevant An integrative approach would conceive that the interaction between these structures is essential for verbal repetition For instance different sectors of the cerebral cortex e g Spt inferior frontal gyrus anterior insula act as hubs dedicated to short term storage of verbal information or articulatory planning and these areas in turn interact through forward and backward white matter projections Importantly white matter pathways should not be considered mere cable like connections as changes in their microstructural properties correlate with focal cortical activity during language processing tasks Despite considerable progress many outstanding questions await response The articles in this Research Topic tackle many different and critical new questions including 1 how white matter pathways instantiate dialogues between different cortical language areas 2 what are the specific roles of different white matter pathways in language functions in normal and pathological conditions 3 what are the language consequences of discrete damage to branches of the dorsal and ventral streams 4 what are the consequences e g release from inhibition of damage to the left white matter pathways in contralateral ones and viceversa 5 how these pathways are reorganised after brain injury 5 can the involvement sparing of white matter pathways be used in outcome prediction and treatment response and 5 can the microstructure of white matter pathways be remodelled with intensive rehabilitation training or biological approaches This Research Topic includes original studies and opinion and review articles which describe new data as well as provocative and insightful interpretations of the recent literature on the role of white matter pathways in verbal repetition in normal and pathological conditions A brief highlight summary of each is provided below

Rosenblueth,2016-11-21 The complexity of living organisms surpasses our unaided habilities of analysis Hence computational and mathematical methods are necessary for increasing our understanding of biological systems At the same time there has been a phenomenal recent progress allowing the application of novel formal methods to new domains This progress has spurred a conspicuous optimism in computational biology This optimism in turn has promoted a rapid increase in collaboration between specialists of biology with specialists of computer

science Through sheer complexity however many important biological problems are at present intractable and it is not clear whether we will ever be able to solve such problems We are in the process of learning what kind of model and what kind of analysis and synthesis techniques to use for a particular problem Some existing formalisms have been readily used in biological problems others have been adapted to biological needs and still others have been especially developed for biological systems This Research Topic has examples of cases 1 employing existing methods 2 adapting methods to biology and 3 developing new methods We can also see discrete and Boolean models and the use of both simulators and model checkers Synthesis is exemplified by manual and by machine learning methods We hope that the articles collected in this Research Topic will stimulate new research

Ellen, 1982-09-30 Human ecology is ultimately part of a general theory of society This is the argument developed here by Roy Ellen whose exploration of the interplay between social organization and ecology in small scale subsistence systems has direct bearings both on the investigation of human environmental relations in general and on contemporary social theory He argues that while ecological study of non industrial societies cannot be elevated to the status of theory domain or discipline it can be represented as a single problematic that historically has acquired some degree of autonomy and which continues to make a significant contribution to a wider anthropology Dr Ellen introduces his subject matter through an extended and systematic discussion of some major frameworks developed within the last hundred years to examine and explain facets of the relationship between culture social organization and the environment determinism possibilism cultural ecology systems theory and ideas derived from modern biology He follows this with a detailed review and appraisal of important recent research involving the use of ecological models methods and data This original and innovative study of the pre eminently social character of human ecological relations will be of considerable interest to all students and researchers concerned with understanding the nature of the relationship between human beings and their environments
