Paving Wall Street Experimental Economics And The Quest For The Perfect Market:

Paving Wall Street Ross M. Miller, 2002 Praise for Paving Wall Street This is a remarkable book that weaves the deep scientific roots of modern finance and modern financial institutions with humorous perspective and considerable wisdom Few understand the pervasive and complex economic principles that govern our world of finance Few are aware of the academic and scientific origins of financial practices and market instruments that are commonplace today Ross Miller uses his experience and talents acquired as an experimental economist to help us understand a world that is contradictory potentially dangerous and paradoxical He entertains us while doing it Charles R Plott Edward S Harkness Professor of Economics and Political Science California Institute of Technology Decisions by millions of individuals produce the fierce tides and churning seas of Wall Street Miller wields his microscope in the laboratory of experimental economics to provide a sprightly and insightful analysis of investor behavior Richard Zeckhauser Frank P Ramsey Professor of Political Economy John F Kennedy School of Government Harvard University Dramatic new ways for buying and selling spectrum auctions e commerce derivatives are the economics profession s contribution to the Information Revolution This book explains how many of these innovations began with simple experiments at Caltech The style is a refreshing combination dramatic and fun to read but also historically and scientifically accurate So I can send one to my Dad a salesman and another to my girlfriend a patent attorney Colin Camerer Rea and Lela Axline Professor of Business Economics California Institute of Technology Paving Wall Street is a first rate insight into bubbles and the experimental research performed on the topic by leading academicians such as Vernon Smith David Dreman Chairman Dreman Value Management Academic ideas have revolutionized how Wall Street operates Entirely new markets have been created This revolution continues today accelerated by the rise of increasingly automated markets Ross Miller has produced a book that makes the leading edge financial and economic thinking that shapes these new markets accessible to practitioners and professionals With no equations and a deft touch this is an excellent guide to the future of greater Wall Street David J Leinweber PhD Economics Social Sciences California Institute of Technology *A Life of Experimental Economics, Volume II* Vernon L. Smith, 2018-11-23 This sequel to A Life of Experimental Economics Volume I continues the intimate history of Vernon Smith s personal and professional maturation after a dozen years at Purdue The scene now shifts to twenty six transformative years at the University of Arizona then to George Mason University and his recognition by the Nobel Prize Committee in 2002 The book ends with his most recent decade at Chapman University At Arizona Vernon and his students studied asset trading markets and learned how wrong it had been to suppose that price bubbles could not occur where markets were full information transparent Their work in computerization of the lab facilitated very complex supply and demand experiments in natural gas pipeline communication and electricity markets that paved the way for implementing through decentralized market processes the liberalization of industries traditionally believed to be natural monopolies The Smart Computer Assisted Market was born Smith s move to George Mason University greatly

facilitated government and industry work in tandem with various public and private entities whereas his relocation to Chapman University coincided with the Great Recession whose similarity with the Depression was evident in his research There he integrated two fundamental kinds of markets with laboratory experiments Consumer non durables the supply and demand for which was stable in the lab and in the economy and durable assets whose bubble tendencies made them unstable in the lab as well as in the economy witness the great housing mortgage market bubble run up of 1997 2007 This book s conversational style and emphasis on the backstory of published research accomplishments allows readers an exclusive peak into how and why economists pursue their work It s a must read for those interested in experimental economics the housing crisis and economic history

Do Economists Make Markets? Donald MacKenzie, Fabian Muniesa, Siu Leung-Sea, 2020-06-30 Around the globe economists affect markets by saying what markets are doing what they should do and what they will do Increasingly experimental economists are even designing real world markets But despite these facts economists are still largely thought of as scientists who merely observe markets from the outside like astronomers look at the stars Do Economists Make Markets boldly challenges this view It is the first book dedicated to the controversial question of whether economics is performative or whether in some cases economics actually produces the phenomena it analyzes The book s case studies including financial derivatives markets telecommunications frequency auctions and individual transferable quotas in fisheries give substance to the notion of the performativity of economics in an accessible nontechnical way Some chapters defend the notion others attack it vigorously The book ends with an extended chapter in which Michel Callon the idea s main formulator reflects upon the debate and asks what it means to say economics is performative The book s insights and strong claims about the ways economics is entangled with the markets it studies should interest and provoke economic sociologists economists and other social scientists In addition to the editors and Callon the contributors include Marie France Garcia Parpet Francesco Guala Emmanuel Didier Philip Mirowski Edward Nik Khah Petter Holm Vincent Antonin L pinay and Timothy Mitchell

The Methodology of Experimental Economics Francesco Guala, 2005-08-01 The experimental approach in economics is a driving force behind some of the most exciting developments in the field The experimental revolution was based on a series of bold philosophical premises which have remained until now mostly unexplored This book provides the first comprehensive analysis and critical discussion of the methodology of experimental economics written by a philosopher of science with expertise in the field It outlines the fundamental principles of experimental inference in order to investigate their power scope and limitations The author demonstrates that experimental economists have a lot to gain by discussing openly the philosophical principles that guide their work and that philosophers of science have a lot to learn from their ingenious techniques devised by experimenters in order to tackle difficult scientific problems

Trading Agents Michael Wellman,2022-05-31 Automated trading in electronic markets is one of the most common and consequential applications of autonomous software agents Design of effective trading strategies requires thorough understanding of how market mechanisms operate and appreciation of strategic issues that commonly manifest in trading scenarios Drawing on research in auction theory and artificial intelligence this book presents core principles of strategic reasoning that apply to market situations The author illustrates trading strategy choices through examples of concrete market environments such as eBay as well as abstract market models defined by configurations of auctions and traders Techniques for addressing these choices constitute essential building blocks for the design of trading strategies for rich market applications The lecture

assumes no prior background in game theory or auction theory or artificial intelligence Table of Contents Introduction Example Bidding on eBay Auction Fundamentals Continuous Double Auctions Interdependent Markets Conclusion **An Engine, Not a Camera** Donald MacKenzie, 2008-08-29 In *An Engine Not a Camera* Donald MacKenzie argues that the emergence of modern economic theories of finance affected financial markets in fundamental ways These new Nobel Prize winning theories based on elegant mathematical models of markets were not simply external analyses but intrinsic parts of economic processes Paraphrasing Milton Friedman MacKenzie says that economic models are an engine of inquiry rather than a camera to reproduce empirical facts More than that the emergence of an authoritative theory of financial markets altered those markets fundamentally For example in 1970 there was almost no trading in financial derivatives such as futures By June of 2004 derivatives contracts totaling 273 trillion were outstanding worldwide MacKenzie suggests that this growth could never have happened without the development of theories that gave derivatives legitimacy and explained their complexities MacKenzie examines the role played by finance theory in the two most serious crises to hit the world's financial markets in recent years the stock market crash of 1987 and the market turmoil that engulfed the hedge fund Long Term Capital Management in 1998 He also looks at finance theory that is somewhat beyond the mainstream chaos theorist Benoit Mandelbrot's model of wild randomness MacKenzie's pioneering work in the social studies of finance will interest anyone who wants to understand how America's financial markets have grown into their current form Trading Agents Michael P. Wellman, 2011 Automated trading in electronic markets is one of the most common and consequential applications of autonomous software agents Design of effective trading strategies requires thorough understanding of how market mechanisms operate and appreciation of strategic issues that commonly manifest in trading scenarios Drawing on research in auction theory and artificial intelligence this book presents core principles of strategic reasoning that apply to market situations The author illustrates trading strategy choices through examples of concrete market environments such as eBay as well as abstract market models defined by configurations of auctions and traders Techniques for addressing these choices constitute essential building blocks for the design of trading strategies for rich market applications The lecture assumes no prior background in game theory or auction theory or artificial intelligence Table of Contents Introduction Example Bidding on eBay Auction Fundamentals Continuous Double Auctions Interdependent Markets Conclusion **Failure by Design** Georg Riling, 2024-08-19 A new framework for studying markets as the product of organizational planning and understanding the practical limits of market design The Western energy crisis was one of the great financial disasters of the past century The crisis began in April 2000 when price spikes started to rattle California's electricity markets Decades later some blame economic fundamentals and ignorant politicians while others accuse the energy sellers who raided the markets In *Failure by Design* sociologist Georg Riling offers a different explanation one that focuses on the practical challenges of market design The unique physical attributes of electricity made it exceedingly difficult to introduce markets into the

coordination of the electricity system so market designers were brought in to construct the infrastructures that coordinate how market participants interact. An exercise in social engineering, these infrastructures were intended to guide market actors toward behavior that would produce optimal market results and facilitate grid management. Yet though these experts spent their days worrying about incentive misalignment and market manipulation, they unintentionally created a system riddled with opportunities for destructive behavior. Riling's analysis not only illuminates the California energy crisis but also develops a broader theoretical framework for thinking about markets as the products of organizational planning and the limits of social engineering, contributing broadly to sociological and economic thinking about the nature of markets.

JOURNAL OF ECONOMIC PSYCHOLOGY, 2003 *National Journal*, 2002 **Autonomous Bidding Agents** Michael P. Wellman, Amy Greenwald, Peter Stone, 2007. E-commerce increasingly provides opportunities for autonomous bidding agents: computer programs that bid in electronic markets without direct human intervention. Automated bidding strategies for an auction of a single good with a known valuation are fairly straightforward; designing strategies for simultaneous auctions with interdependent valuations is a more complex undertaking. This book presents algorithmic advances and strategy ideas within an integrated bidding agent architecture that have emerged from recent work in this fast-growing area of research in academia and industry. The authors analyze several novel bidding approaches that developed from the Trading Agent Competition (TAC), held annually since 2000. The benchmark challenge for competing agents to buy and sell multiple goods with interdependent valuations in simultaneous auctions of different types encourages competitors to apply innovative techniques to a common task. The book traces the evolution of TAC and follows selected agents from conception through several competitions, presenting and analyzing detailed algorithms developed for autonomous bidding. **Autonomous Bidding Agents** provides the first integrated treatment of methods in this rapidly developing domain of AI. The authors who introduced TAC and created some of its most successful agents offer both an overview of current research and new results. Michael P. Wellman is Professor of Computer Science and Engineering and member of the Artificial Intelligence Laboratory at the University of Michigan, Ann Arbor. Amy Greenwald is Assistant Professor of Computer Science at Brown University. Peter Stone is Assistant Professor of Computer Sciences, Alfred P. Sloan Research Fellow, and Director of the Learning Agents Group at the University of Texas at Austin. He is the recipient of the International Joint Conference on Artificial Intelligence (IJCAI) 2007 Computers and Thought Award.
