Retrofitting Fossil Plant Facilities American Society of Civil Engineers. Retrofit Task Committee, 1991 Prepared by the Retrofit Task Committee of the Fossil Power Committee of the American Society of Civil Engineers This report is suitable for engineers who are responsible for retrofitting fossil power plant facilities *Optimal Design and Retrofit of Energy Efficient Buildings, Communities, and Urban Centers* Moncef Krarti, 2018-03-27 Optimal Design and Retrofit of Energy Efficient Buildings Communities and Urban Centers presents current techniques and technologies for energy efficiency in buildings Cases introduce and demonstrate applications in both the design of new buildings and retrofit of existing structures The book begins with an introduction that includes energy consumption statistics building energy efficiency codes and standards and labels from around the world It then highlights the need for integrated and comprehensive energy analysis approaches Subsequent sections present an overview of advanced energy efficiency technologies for buildings including dynamic insulation materials phase change materials LED lighting and daylight controls Life Cycle Analysis and more This book provides researchers and professionals with a coherent set of tools and techniques for enhancing energy efficiency in new and existing buildings The case studies presented help practitioners implement the techniques and technologies in their own projects Introduces a holistic analysis approach to energy efficiency for buildings using the concept of energy productivity Provides coverage of individual buildings communities and urban centers Includes both the design of new buildings and retrofitting of existing structures to improve energy efficiency Describes state of the art energy efficiency technologies Presents several cases studies and examples that illustrate the analysis techniques and impact of energy efficiency technologies and controls Fossil Energy Update ,1977 Solar Energy Update ,1980 **Electric Power Research Trends** Michael C. Schmidt, 2007 The world is becoming increasingly electrified For the foreseeable future coal will continue to be the dominant fuel used for electric power production The low cost and abundance of coal is one of the primary reasons for this Electric power transmission a process in the delivery of electricity to consumers is the bulk transfer of electrical power Typically power transmission is between the power plant and a substation near a populated area Electricity distribution is the delivery from the substation to the consumers Due to the large amount of power involved transmission normally takes place at high voltage 110 kV or above Electricity is usually transmitted over long distance through overhead power transmission lines Underground power transmission is used only in densely populated areas due to its high cost of installation and maintenance and because the high reactive power gain produces large charging currents and difficulties in voltage management A power transmission system is sometimes referred to colloquially as a grid however for reasons of economy the network is rarely a true grid Redundant paths and lines are provided so that power can be routed from any power plant to any load centre through a variety of routes based on the economics of the transmission path and the cost of power Much analysis is done by transmission companies to determine the maximum reliable capacity of each line

which due to system stability considerations may be less than the physical or thermal limit of the line Deregulation of electricity companies in many countries has led to renewed interest in reliable economic design of transmission networks This new book presents leading edge research on electric power and its generation transmission and efficiency
