Recombinant Antibodies:

Recombinant Antibodies for Immunotherapy Melvyn Little, 2009-07-27 This book provides a comprehensive overview of the field of monoclonal antibodies through twenty five articles by recognized experts in the field **Recombinant Antibodies** Frank Breitling, Stefan Dübel, 1999-09-30 As new recombinant DNA technology continues to join with cellular and molecular immunology the field of antibody engineering has become a flourishing discipline Antibody genes are now being cloned genetically manipulated and expressed to produce antigen binding proteins Recombinant Antibodies addresses this burgeoning field with its comprehensive survey of the developing possibilities for producing specific antibodies by combinatorial methods Following a comprehensive introduction to the field the book is divided into four parts a detailed introduction to the underlying concepts of recombinant antibodies a description of the various methods for the generation of recombinant antibodies their production and purification and various designs and applications of genetically engineered proteins The combination of these techniques substantially extends the functionality of natural antibodies In addition the book will focus on Hybridoma immortalization Generation and functional screening of highly complex antibody gene libraries Human monoclonal antibodies to highly toxic and pathogenic antigens Improving specificity or affinity of antibodies New agents for cancer diagnosis and therapy Genetic fusions for the production of bi and multifunctional molecules Production of large quantities of recombinant antibodies New methods of purification Emerging technologies Recombinant Antibodies is the first general overview of the emerging field of antibody engineering and will serve as the definitive source for researchers and engineers in biology and medicine biochemistry immunology and molecular biology as well as anyone who is interested in biotechnology and antibody engineering **Recombinant Antibodies for Infectious Diseases** Theam Soon Lim, 2018-03-16 There are many principles and applications of recombinant antibodies for infectious diseases The preferred technology associated to recombinant antibody generation is mainly phage display The adaptation of antibodies for infectious diseases is an area lacking information as most literature is focused on oncology or autoimmunity This project highlights the power and potential of antibody phage display for infectious diseases In addition to that supplementary information regarding technologies associated to antibody generation and engineering in the context of infectious disease will also help to provide greater insight to the potential of recombinant antibodies for infectious diseases Recombinant Antibodies Karen Harper, Angelika Ziegler, 1999-07-22 The first part of this book combines basic information on antigens and antibodies with a review of technologies for both the development of recombinant antibodies and their application The principles involved in producing recombinant antibodies from either pre existing monoclonal antibodies or from phage display libraries are introduced with practical examples Modern methods for the analysis of antibody binding properties are described in detail Examples are given in the second part of this book for the application of recombinant antibody technology to antibody mediated resistance to plant disease and immunomodulation of plant antigens The potential of antibody expressing plants as

bioreactors for large scale production and storage of recombinant antibodies is described and a future outlook given

Recombinant Antibodies for Cancer Therapy Martin Welschof, Jürgen Krauss, 2008-02-05 Since the advent of hybridoma technology more than two decades ago numerous antibodies have entered the clinical setting as potent therapeutic agents Their repeated application in humans however is limited by the development of human antimouse antibodies HAMA in the recipient leading to allergic reactions against the foreign murine protein and rapid neutralization To circumvent these limitations many new antibodies have recently been tailored through recombinant antibody technology The initial clinical data show encouraging results thus demonstrating the potential of these new therapeutic agents The purpose of *Recombinant Antibodies for Cancer Therapy* is to present a collection of detailed protocols in recombinant antibody technology It is primarily addressed to scientists working on recombinant antibodies as well as clinicians involved with antibody based therapies As with other volumes of this series we placed the main focus on providing detailed protocols describing procedures step by step Moreover each protocol supplies a troubleshooting guide containing detailed information on possible problems and hints for potential solutions Antibody technology is a subject of constant and rapid change This volume therefore does not attempt to cover all possible current experimental approaches in the field Rather we present carefully selected protocols written by competent authors who have successfully verified the particular method described Given our own professional backgrounds and interest in oncology we chose to concentrate chiefly on therapeutic agents for cancer patients

Antibody Engineering Roland Kontermann, Stefan Dübel, 2001 Biological chemistry is a major frontier of inorganic chemistry Three special volumes devoted to Metal Sites in Proteins and Models address the questions How unusual are metal sites in metalloproteins and metalloenzymes compared to those in small coordination complexes And if they are special how do polypeptide chains and cofactors control this The chapters deal with iron with metal centres acting as Lewis acids metals in phosphate enzymes with vanadium and with the wide variety of transition metal ions which act as redox centres They illustrate in particular how the combined armoury of genetics and structure determination at the molecular level are providing unprecedented new tools for molecular engineering
