Recommendations On Excavations:

Recommendations on Excavations Deutsche Gesellschaft für Geotechnik e.V. / German Geotechnical Society, 2008-06-23 The aim of these recommendations is to harmonize and further develop the methods according to which excavations are prepared, calculated and carried out. Since 1980 these have been drawn up by the working group Excavations at the German Geotechnical Society Deutsche Gesellschaft für Geotechnik DGGT and are similar to a set of standards. They help to simplify analysis of excavation enclosures to unify load approaches and analysis procedures to guarantee the stability and serviceability of the excavation structure and its individual components and to find out an economic design of the excavation structure. For this new edition all recommendations have been reworked in accordance with EN 1997-1 Eurocode 7 and DIN 1054-1. In addition, new recommendations on the use of the modulus of subgrade reaction method and the finite element method FEM as well as a new chapter on excavations in soft soils have been added.

Recommendations on Excavations Deutsche Gesellschaft für Geotechnik, 2013-12-02 With the issue of these recommendations which have the character of a standard, the Building Excavations working group of the German Geotechnics Association DGGT aims to provide assistance with the design and structural calculation of excavation support works. The introduction of the Eurocodes for building control purposes made necessary a revision of the previous edition of the recommendations to comply with the requirements of DIN EN 1997-1:2009 together with the national annex DIN EN 1997-1:NA:2010-12 and the supplementary regulations of DIN 1054:2010-12. All recommendations were thoroughly checked, revised where necessary and adapted to new knowledge. Chapter 10 Building excavations in water was substantially revised. Due to the progress of development of measurement instruments and the more stringent requirements, Chapter 14 Instrumentation for the monitoring and supervision of building excavation support works was formulated completely anew. The recommendations of the working group Building Excavations should be of assistance to simplify the design and structural calculation of excavation support works to harmonise loading assumptions and calculation procedures to ensure the structural stability of excavation support works and their individual elements and to improve the cost effectiveness of

Response of Piled Buildings to the Construction of Deep Excavations M. Korff, IOS Press, 2013-06-13 Deep excavations in densely populated urban areas around the world pose specific challenges due to the increasingly complex conditions in which they are undertaken The construction of underground car parks cellar storage areas and major infrastructure in deep excavations

helps to preserve the quality of space above ground Despite the considerable effort that goes into their design and construction such projects often encounter problems such as damage to existing structures delays and cost overruns This book presents the results of an extensive research project conducted at the University of Cambridge in cooperation with the Netherlands Centre of Underground Construction COB and Deltares the Dutch Institute for water subsurface and infrastructure issues The study gained insight into mechanisms of soil structure interaction for piled buildings adjacent to deep excavations and resulted in suggestions for designing and monitoring deep excavations in urban areas with soft soil conditions Monitoring data of the construction of three deep excavations for the North South metro line in Amsterdam the Netherlands have been used to validate the methods described This book aims to contribute to the reduction of failure costs in the building industry and in underground construction in particular
