*Recommended Practice for Backflow Prevention and Cross-connection Control* American Water Works Association, 1966

**Recommended Practice for Backflow Prevention and Cross-connection Control** AWWA Staff, 2003

Cross connection control is one of the most important barriers in the multiple barrier approach drinking water suppliers use to protect public health. Contamination of a drinking water distribution system through a cross connection often results in immediate adverse health effects, illness or even death. This Manual provides a total cross connection control program for your water system. The manual explains how cross connections and backflow can occur and tells you how to choose, install and maintain backflow prevention devices. You will learn the water purveyor's legal responsibilities as well as the customer's responsibilities in backflow prevention. The manual covers risk assessment, types of programs to consider and program administration. Until the cross connection control program is fully developed, the water purveyor is at maximum risk of potential liability. This Manual also explains the hydraulics of backflow, the two types of backflow: backsiphonage and backpressure, and the conditions that can cause backflow and a potential cross connection such as a water main break. You will get expert guidance in selecting and installing backflow prevention equipment and learn the 10 main types of backflow prevention devices or assemblies, why they are different and the relative effectiveness of each type against backsiphonage, backpressure and low and high hazards. The manual describes each device or assembly, its application in a water system, installation requirements. Detailed assembly test procedures are included for the different types of devices and assemblies. This Manual recommends backflow prevention equipment for installation in the water distribution system as well as raw water storage reservoirs, chemical feed pumps and injectors, filters, surface washers, saturators and dry chemical solution tanks, sampling lines, hose bib connections and membrane systems.

Association, 2004. This manual describes the causes and prevention of backflow and cross connections in potable water systems. Here is complete guidance for establishing a cross connection backflow prevention program for a water utility. You will learn the water purveyor's legal responsibilities as well as the customer's responsibilities in backflow prevention. The manual covers risk assessment, types of programs to consider and program administration. Until the cross connection control program is fully developed, the water purveyor is at maximum risk of potential liability. As more water systems turn to safer alternatives to chlorine gas the generation of hypochlorite on site has become increasingly common M65 On Site Generation of Hypochlorite presents the principles of on site generation OSG the differences between low strength and high strength OSG systems and the subsequent impact each of these systems has on design construction and maintenance for water and wastewater utilities M65 provides operators and engineering staff with a basic understanding of how to design and install both low and high strength OSG systems how they work and how they compare with other popular forms of chlorine currently on the market A cost analysis and an examination of how OSG affects disinfection by product formation are also included This manual should help operators planners management and engineers improve their decision making processes about OSG systems using a holistic risk management approach that considers not only triple bottom line approaches but also the specific regional situation when choosing a chlorination system Need it now Learn about AWWA's digital downloads      Pathogen Intrusion Into the Distribution System Gregory J. Lee, P. Schwartz, P. Sylvester, L. Crane, J. Haw, H. Chang, H. Kwon, 2004-01-01 For many years cross connections and backflow have been well understood Programs to prevent unhealthy situations from happening have been in place for many years However a general and extensive study on their impacts types of programs incidents and financial repercussions has not been conducted Many computer models for steady state or quasi steady state simulation exist but applications for transient state simulation especially demonstrating backflow incidents have rarely been done The first objective of this project was to assess the impacts financial and otherwise of cross connections and cross connection control in North American water supplies and to North American water purveyors The project team also planned to create and use a computer model to simulate and demonstrate hydraulic changes in the transient state Of the over 700 utilities surveyed 91% were found to have a cross connection control program Survey data indicated 65% of cross connections were indirect and 35% were direct Sudden changes of water demands in piping networks can cause sub atmospheric pressures within the systems resulting in backflow incidents Systems with larger variances in ground elevations have the greater possibility of creating sub atmospheric pressures as water demands in the systems change Originally published by AwwaRF for its subscribers in 2003 This publication can also be purchased and downloaded via Pay Per View on Water Intelligence Online
