

Red Giants and White Dwarfs

- Red Giants and Supergiants:
 - No longer a main sequence star, the Sun will become a **red giant** in about 5 billion years.
 - As its core contracts and heats to 100 million degrees, helium nuclei will fuse into **carbon**.
 - Its outer layers will expand as the sun swells to about 2 AU in diameter.
- Becoming a White Dwarf:
 - A star like the Sun will use up its helium and its core will contract even more.
 - The Sun's outer layers will escape to space leaving behind a hot, dense core: a "**white dwarf**."
 - A white dwarf is only about the size of the Earth.

Iben, Alvio

Renzini,2012-12-06 In recent years it has become clear that the red giant phase is one of the most dramatic periods in a star's life when all of its parts become involved in ways that have both direct and indirect observational consequences. This is most particularly true of low and intermediate mass stars during the second ascent of the giant branch. Such stars bring to their surfaces products of nucleosynthesis currently taking place in their deep interiors; they pulsate as Mira variables; develop extended outward flowing atmospheres that may exhibit maser properties and shed great quantities of matter, sometimes highly processed into the interstellar medium. The manner in which processed matter is brought to the surface is far from being completely explained and the precise mechanism or mechanisms whereby matter is ejected from the stellar surface, whether by deposition of Alfvén waves, radiation pressure on grains or as a consequence of some large scale envelope instability, has yet to be elucidated to everyone's satisfaction. The purpose of the second workshop in Astrophysics organized by the Advanced School of Astronomy was to bring together experts on all the physical processes occurring in red giants in an effort to emphasize the interrelatedness of these individual processes and to encourage a dialogue among experts that might serve to initiate a synthesis or at least sharpen our understanding of the most important problems to address in the future.

Supernova Explosions David Branch, J. Craig Wheeler, 2017-08-02 Targeting advanced students of astronomy and physics as well as astronomers and physicists contemplating research on supernovae or related fields, David Branch and J. Craig Wheeler offer a modern account of the nature, causes and consequences of supernovae as well as of issues that remain to be resolved. Owing especially to 1 the appearance of supernova 1987A in the nearby Large Magellanic Cloud, 2 the spectacularly successful use of supernovae as distance indicators for cosmology, 3 the association of some supernovae with the enigmatic cosmic gamma-ray bursts and 4 the discovery of a class of superluminous supernovae, the pace of supernova research has been increasing sharply. This monograph serves as a broad survey of modern supernova research and a guide to the current literature. The book's emphasis is on the explosive phases of supernovae. Part 1 is devoted to a survey of the kinds of observations that inform us about supernovae, some basic interpretations of such data and an overview of the evolution of stars that brings them to an explosive endpoint. Part 2 goes into more detail on core collapse and superluminous events, which kinds of stars produce them and how they do it. Part 3 is concerned with the stellar progenitors and explosion mechanisms of thermonuclear Type Ia supernovae. Part 4 is about consequences of supernovae and some applications to astrophysics and cosmology. References are provided in sufficient number to help the reader enter the literature.

The Encyclopedia of Science and Technology James Trefil, 2001-08-24 Edited by acclaimed science writer and physicist James Trefil, the Encyclopedia's 1000 entries combine in-depth coverage with a vivid graphic format to bring every facet of science, technology and medicine into stunning focus. From absolute zero to the Mesozoic era, to semiconductors to the twin paradox, Trefil and his co-authors have an uncanny ability to convey how the universe works and to show readers how to apply that knowledge to everyday problems.

Habing,2019-03-23 This richly illustrated book discusses the ways in which astronomy expanded after 1945 from a modest discipline to a robust and modern science It begins with an introduction to the state of astronomy in 1945 before recounting how in the following years initial observations were made in hitherto unexplored ranges of wavelengths such as X radiation infrared radiation and radio waves These led to the serendipitous discovery of more than a dozen new phenomena including quasars and neutron stars that each triggered a new area of research The book goes on to discuss how after 1985 the further systematic exploration of the earlier discoveries led to long term planning and the construction of new large telescopes on Earth and in Space Key scientific highlights described in the text are the detection of exoplanets 1995 the unexpected discovery of the accelerated expansion of the Universe 1999 a generally accepted model for the large scale properties of the Universe 2003 and the CDM theory 2005 that explains how the galaxies and stars of the present Universe were formed from minute irregularities in the almost homogenous gas that filled the early Universe All these major scientific achievements came at a price namely the need to introduce two new phenomena that are as yet unexplained by physics inflation and dark energy Probably the deepest unsolved question has to be Why did all of this start with a Big Bang Cranial Creations in Physical Science Charles R. A History of Astronomy David Leverington, 2012-12-06 The history of astronomy is like most history: a multidimensional story. And when writing about a specific period, the author has to decide how to handle all the developments of earlier times in order to set the scene. I have done this by starting most chapters of the book with a summary of astronomical knowledge at the beginning of our chosen period, together with a brief review of how such knowledge had been gained. This story is not only interesting in itself, but it will also assist those readers that would appreciate a brief reminder of some of the basic elements of astronomy. It is also necessary to decide when to start our history. Should it be the year 1900 or 1890, or should it be linked to some key development or investigation, e.g. the discovery of the electron by J. J. Thomson in 1897, or the discovery of spectroscopic binary stars by Pickering and Vogel independently in 1889, or maybe the year 1890 in which Thomas Edison tried unsuccessfully to detect radio waves from the Sun, and Johannes Rydberg published his formula for atomic spectra? I have in fact decided to start this history at about 1890, as it was the year of publication of the Draper Memorial Catalogue of stellar spectra, which together with its updates provided essential data for the understanding of stellar spectra until well into the twentieth century. This date also gives a clear hundred years up to the present.
