

# Reconsideration: Exploratory Plant Change

By Michael J. Kinsella, Ph.D., and Mark A. Johnson, Ph.D.

Two researchers from the University of Missouri-Columbia share their thoughts on the future of plant breeding.

Michael J. Kinsella is a professor of plant breeding and genetics at the University of Missouri-Columbia. Mark A. Johnson is a research scientist at the University of Missouri-Columbia.

Plant breeding has been a major force in agriculture since the beginning of recorded history. In fact, it is estimated that 95 percent of all food consumed today is the result of plant breeding.

While plant breeding has been a major force in agriculture, it has also been a major force in the development of new technologies. In fact, plant breeding has been a major force in the development of new technologies.

For example, the development of hybrid corn was a major breakthrough in plant breeding. Hybrid corn is a type of corn that is produced by crossing two different varieties of corn. This results in a plant that is more resistant to pests and diseases than either of the original varieties.

Another example of a major breakthrough in plant breeding is the development of transgenic plants. Transgenic plants are plants that have been modified to contain genes from other organisms.

Transgenic plants have been used to develop new varieties of crops that are more resistant to pests and diseases. They have also been used to develop new varieties of crops that are more nutritious.

Plant breeding has also been used to develop new varieties of crops that are more efficient. For example, the development of hybrid rice has resulted in a significant increase in rice production in many parts of the world.

Plant breeding has also been used to develop new varieties of crops that are more sustainable. For example, the development of organic crops has resulted in a significant increase in the production of organic crops.

Plant breeding has also been used to develop new varieties of crops that are more profitable. For example, the development of genetically modified crops has resulted in a significant increase in the production of genetically modified crops.

Plant breeding has also been used to develop new varieties of crops that are more accessible. For example, the development of biopesticides has resulted in a significant increase in the production of biopesticides.

Plant breeding has also been used to develop new varieties of crops that are more nutritious. For example, the development of biofertilizers has resulted in a significant increase in the production of biofertilizers.

Plant breeding has also been used to develop new varieties of crops that are more efficient. For example, the development of biopesticides has resulted in a significant increase in the production of biopesticides.
