Epidemiology of Antimicrobial Resistance and Virulence Factors of Emerging and Re-emerging bacteria Rosa Del Carmen Rocha-Gracia, Gerardo Cortés Cortés, Manuel Gerardo Ballesteros Monreal, Margarita María De La Paz Arenas-Hernandez, Edwin Barrios-Villa, 2025-03-20 Infectious diseases caused by bacteria are one of the most important health problems worldwide. This is due to the increase in the prevalence of multidrug resistant bacteria. The increased antibiotic resistance in these pathogens may be related to the inadequate use and abuse of antimicrobials in humans as well as in domestic animals or those destined for consumption. In addition, the virulence characteristics of bacterial pathogens play a transcendental role in the development and persistence of the infectious process, and it has been observed that virulence characteristics such as biofilm or cell invasion also influence therapeutic failure. Both virulence factors and antibiotic resistance determinants are commonly encoded in mobilizable genetic elements, which has favored their dissemination and the emergence of highly virulent and antimicrobial resistant bacterial clinical isolates. Both of these properties in co-occurrence pose a real challenge in the diagnosis, management, and treatment of an infectious process. Molecular factors including repressors, operators, enhancers, and insertion sequences may be involved in the repression and overexpression of genes or gene clusters and may contribute to the expression levels of virulence and resistance genes.
