Recrystallization and Related Annealing Phenomena F. J. Humphreys, Max Hatherly, 1996 The annealing of deformed materials is of both technological importance and scientific interest The phenomena have been most widely studied in metals although they occur in all crystalline materials such as the natural deformation of rocks and the processing of technical ceramics Research is mainly driven by the requirements of industry and where appropriate the book discusses the extent to which we are able to formulate quantitative physically based models which can be applied to metal forming processes The subjects treated in this book are all active research areas and form a major part of at least four

regular international conference series However there have only been two monographs published in recent times on the subject of recrystallization the latest nearly 20 years ago Since that time considerable advances have been made both in our understanding of the subject and in the techniques available to the researcher The book covers recovery recrystallization and grain growth in depth including specific chapters on ordered materials two phase alloys annealing textures and annealing during and after hot working Also contained are treatments of the deformed state and the structure and mobility of grain boundaries technologically important examples and a chapter on computer simulation and modelling The book provides a scientific treatment of the subject for researchers or students in Materials Science Metallurgy and related disciplines who require a more detailed coverage than is found in textbooks on physical metallurgy and a more coherent treatment than will be found in the many conference proceedings and review articles
