Red Of Varieties And Schemes:

The Red Book of Varieties and Schemes David Mumford, 2004-02-21 Mumford's famous Red Book gives a simple readable account of the basic objects of algebraic geometry preserving as much as possible their geometric flavor and integrating this with the tools of commutative algebra. It is aimed at graduates or mathematicians in other fields wishing to quickly learn about algebraic geometry. This new edition includes an appendix that gives an overview of the theory of curves, their moduli spaces and their Jacobians, one of the most exciting fields within algebraic geometry.

One-dimensional Fields Fedor Bogomolov, Tihomir Petrov, Algebraic curves have many special properties that make their study particularly rewarding. As a result, curves provide a natural introduction to algebraic geometry. In this book, the authors also bring out aspects of curves that are unique to them and emphasize connections with algebra. This text covers the essential topics in the geometry of algebraic curves such as line bundles and vector bundles, the Riemann-Roch Theorem, divisors, coherent sheaves, and zeroth and first cohomology groups. The authors make a point of using concrete examples and explicit methods to ensure that the style is clear and understandable. Several chapters develop the connections between the geometry of algebraic curves and the algebra of one-dimensional fields. This is an interesting topic that is rarely found in introductory texts on algebraic geometry. This book makes an excellent text for a first course for graduate students.

Hilbert Schemes of Zero-Dimensional Subschemes of Smooth Varieties Lothar Göttsche, 2006-11-15 In this book we study Hilbert schemes of zero-dimensional subschemes of smooth varieties and several related parameter varieties of interest in enumerative geometry. The main aim here is to describe their cohomology and Chow rings. Some enumerative applications are also given. The Weil conjectures are used to compute the Betti numbers of many of the varieties considered, thus also illustrating how this powerful tool can be applied. The book is essentially self-contained, assuming only a basic knowledge of algebraic geometry; it is intended both for graduate students and research mathematicians interested in Hilbert schemes, enumerative geometry, and moduli spaces.

Rational Points on Varieties Bjorn Poonen, 2023-08-10 This book is motivated by the problem of determining the set of rational points on a variety, but its true goal is to equip readers with a broad range of tools essential for current research in algebraic geometry and number theory. The book is unconventional in that it provides concise accounts of many topics instead of a comprehensive account of just one; this is intentionally designed to bring readers up to speed rapidly. Among the topics included are Brauer groups, faithfully flat descent, algebraic groups, torsors, Tate and fppf cohomology, the Weil conjectures, and the Brauer-Manin and descent obstructions. A final chapter applies all these to study the arithmetic of surfaces. The down-to-earth explanations and the over 100 exercises make the book suitable for use as a graduate-level textbook, but even experts will appreciate having a single source covering many aspects of

geometry over an unrestricted ground field and containing some material that cannot be found elsewhere The origins of arithmetic or Diophantine geometry can be traced back to antiquity and it remains a lively and wide research domain up to our days The book by Bjorn Poonen a leading expert in the field opens doors to this vast field for many readers with different experiences and backgrounds It leads through various algebraic geometric constructions towards its central subject obstructions to existence of rational points Yuri Manin Max Planck Institute Bonn It is clear that my mathematical life would have been very different if a book like this had been around at the time I was a student Hendrik Lenstra University Leiden Understanding rational points on arbitrary algebraic varieties is the ultimate challenge We have conjectures but few results Poonen's book with its mixture of basic constructions and openings into current research will attract new generations to the Queen of Mathematics Jean Louis Colliot Thélène Université Paris Sud A beautiful subject handled by a master Joseph Silverman Brown University

Representations of Algebras and Related Topics Andrzej Skowroński, Kunio Yamagata, 2011 This book which explores recent trends in the representation theory of algebras and its exciting interaction with geometry topology commutative algebra Lie algebras combinatorics quantum algebras and theoretical field is conceived as a handbook to provide easy access to the present state of knowledge and stimulate further development The many topics discussed include quivers quivers with potential bound quiver algebras Jacobian algebras cluster algebras and categories Calabi Yau algebras and categories triangulated and derived categories and quantum loop algebras This book consists of thirteen self contained expository survey and research articles and is addressed to researchers and graduate students in algebra as well as a broader mathematical community The articles contain a large number of examples and open problems and give new perspectives for research in the field

Algebraic Geometry II: Cohomology of Schemes Ulrich Görtz, Torsten Wedhorn, 2023-11-22 This book completes the comprehensive introduction to modern algebraic geometry which was started with the introductory volume Algebraic Geometry I Schemes It begins by discussing in detail the notions of smooth unramified and étale morphisms including the étale fundamental group The main part is dedicated to the cohomology of quasi coherent sheaves The treatment is based on the formalism of derived categories which allows an efficient and conceptual treatment of the theory which is of crucial importance in all areas of algebraic geometry After the foundations are set up several more advanced topics are studied such as numerical intersection theory an abstract version of the Theorem of Grothendieck Riemann Roch the Theorem on Formal Functions Grothendieck's algebraization results and a very general version of Grothendieck duality The book concludes with chapters on curves and on

abelian schemes which serve to develop the basics of the theory of these two important classes of schemes on an advanced level and at the same time to illustrate the power of the techniques introduced previously The text contains many exercises that allow the reader to check their comprehension of the text present further examples or give an outlook on further results

Algebraic Groups: Structure and Actions Mahir Bilen Can, 2017-04-06 This volume contains the proceedings of the 2015 Clifford Lectures on Algebraic Groups Structures and Actions held from March 2 5 2015 at Tulane University New Orleans Louisiana This volume consists of six articles on algebraic groups including an enhanced exposition of the classical results of Chevalley and Rosenlicht on the structure of algebraic groups an enhanced survey of the recently developed theory of pseudo reductive groups and an exposition of the recently developed operational theory for singular varieties In addition there are three research articles containing previously unpublished foundational results on birational automorphism groups of algebraic varieties solution of Hermite Joubert problem over closed fields and cohomological invariants and applications to classifying spaces The old and new results presented in these articles will hopefully become cornerstones for the future development of the theory of algebraic groups and applications Graduate students and researchers working in the fields of algebraic geometry number theory and representation theory will benefit from this unique and broad compilation of fundamental results on algebraic group theory

The Brauer-Grothendieck Group Jean-Louis Colliot-Thélène, Alexei N. Skorobogatov, 2021-07-30 This monograph provides a systematic treatment of the Brauer group of schemes from the foundational work of Grothendieck to recent applications in arithmetic and algebraic geometry The importance of the cohomological Brauer group for applications to Diophantine equations and algebraic geometry was discovered soon after this group was introduced by Grothendieck The Brauer Manin obstruction plays a crucial role in the study of rational points on varieties over global fields The birational invariance of the Brauer group was recently used in a novel way to establish the irrationality of many new classes of algebraic varieties The book covers the vast theory underpinning these and other applications Intended as an introduction to cohomological methods in algebraic geometry most of the book is accessible to readers with a knowledge of algebra algebraic geometry and algebraic number theory at graduate level Much of the more advanced material is not readily available in book form elsewhere notably de Jong s proof of Gabber s theorem the specialisation method and applications of the Brauer group to rationality questions an in depth study of the Brauer Manin obstruction and proof of the finiteness theorem for the Brauer group of abelian varieties and K3 surfaces over finitely generated fields The book surveys recent work but also gives detailed proofs of basic theorems maintaining a balance between general theory and concrete examples Over half a century after Grothendieck s foundational seminars on the topic *The Brauer-Grothendieck Group* is a treatise that fills a longstanding gap in the literature providing researchers including research students with a valuable reference on a central object of algebraic and arithmetic geometry

Abelian Varieties and Number Theory Moshe Jarden, Tony Shaska, 2021-05-03 This book is a collection of articles on Abelian varieties and

number theory dedicated to Gerhard Frey's 75th birthday. It contains original articles by experts in the area of arithmetic and algebraic geometry. The articles cover topics on Abelian varieties and finitely generated Galois groups, ranks of Abelian varieties and Mordell Lang conjecture, Tate Shafarevich group and isogeny volcanoes, endomorphisms of superelliptic Jacobians, obstructions to local-global principles over semi-global fields, Drinfeld modular varieties, representations of étale fundamental groups and specialization of algebraic cycles. Deuring's theory of constant reductions etc. The book will be a valuable resource to graduate students and experts working on Abelian varieties and related areas.

Moduli of Supersingular Abelian Varieties

Ke-Zheng Li, Frans Oort, 2006-11-14 Abelian varieties can be classified via their moduli. In positive characteristic the structure of the p -torsion structure is an additional useful tool. For that structure supersingular abelian varieties can be considered the most special ones. They provide a starting point for the fine description of various structures. For low dimensions the moduli of supersingular abelian varieties is by now well understood. In this book we provide a description of the supersingular locus in all dimensions. In particular we compute the dimension of it; it turns out to be equal to $g(g-4)$ and we express the number of components as a class number, thus completing a long historical line where special cases were studied and general results were conjectured. Deuring, Hasse, Igusa, Oda, Oort, Katsura, Oort.

Algebraic Geometry I: Schemes Ulrich Görtz, Torsten

Wedhorn, 2020-07-27 This book introduces the reader to modern algebraic geometry. It presents Grothendieck's technically demanding language of schemes that is the basis of the most important developments in the last fifty years within this area. A systematic treatment and motivation of the theory is emphasized using concrete examples to illustrate its usefulness. Several examples from the realm of Hilbert modular surfaces and of determinantal varieties are used methodically to discuss the covered techniques. Thus the reader experiences that the further development of the theory yields an ever better understanding of these fascinating objects. The text is complemented by many exercises that serve to check the comprehension of the text, treat further examples or give an outlook on further results. The volume at hand is an introduction to schemes. To get started it requires only basic knowledge in abstract algebra and topology. Essential facts from commutative algebra are assembled in an appendix. It will be complemented by a second volume on the cohomology of schemes.

Families of Varieties of General Type János Kollár, Klaus Altmann, Sándor József Kovács, 2023-04-20 The first complete treatment of the moduli theory of varieties of general type, laying foundations for future research.

Introduction to Algebraic Geometry Steven Dale Cutkosky, 2018-06-01 This book presents a readable and accessible introductory course in algebraic geometry with most of the fundamental classical results presented with complete proofs. An emphasis is placed on developing connections between geometric and algebraic aspects of the theory. Differences between the theory in characteristic 0 and positive characteristic are emphasized. The basic tools of classical and modern algebraic geometry are

introduced including varieties schemes singularities sheaves sheaf cohomology and intersection theory Basic classical results on curves and surfaces are proved More advanced topics such as ramification theory Zariski's main theorem and Bertini's theorems for general linear systems are presented with proofs in the final chapters With more than 200 exercises the book is an excellent resource for teaching and learning introductory algebraic geometry

On the Geometry of Some Special Projective Varieties Francesco Russo, 2016-01-25 Providing an introduction to both classical and modern techniques in projective algebraic geometry this monograph treats the geometrical properties of varieties embedded in projective spaces their secant and tangent lines the behavior of tangent linear spaces the algebro geometric and topological obstructions to their embedding into smaller projective spaces and the classification of extremal cases It also provides a solution of Hartshorne's Conjecture on Complete Intersections for the class of quadratic manifolds and new short proofs of previously known results using the modern tools of Mori Theory and of rationally connected manifolds The new approach to some of the problems considered can be resumed in the principle that instead of studying a special embedded manifold uniruled by lines one passes to analyze the original geometrical property on the manifold of lines passing through a general point and contained in the manifold Once this embedded manifold usually of lower codimension is classified one tries to reconstruct the original manifold following a principle appearing also in other areas of geometry such as projective differential geometry or complex geometry
