Montero, Pedro Dolabella Portella, Jack Telesman, 2012-10-02 A superalloy or high performance alloy is an alloy that exhibits excellent mechanical strength at high temperatures Superalloy development has been driven primarily by the aerospace and power industries This compilation of papers from the Twelfth International Symposium on Superalloys held from September 9 13 2012 offers the most recent technical information on this class of materials **Superalloys, Supercomposites and Superceramics** John K Tien, 2012-12-02 Superalloys Supercomposites and Superceramics reviews the state of superalloy technology and some of the more salient aspects of alternative high temperature systems such as superceramics and supercomposites Superalloy topics range from resource availability to advanced processing such as VIM VAR and VADAR along with investment casting and single crystal growth new superplastic forming techniques and powder metallurgy structure property relationships strengthening mechanisms oxidation hydrogen embrittlement and phase predictions This book is comprised of 22 chapters that explore key issues of high temperature materials in a synergistic manner The first chapter reflects on the growth of the superalloy industry and its technology over the past 40 years The discussion then turns to some of the trends in superalloy development focusing on what is understood to be meant by the term strategic materials and the current status of resources and reserves in the United States Particular attention is given to the supply sources and availability of strategic materials The results achieved from the research program undertaken by NASA Lewis Research Center named Conservation Of Strategic Aerospace Materials COSAM are also presented The chapters that follow explore alternative high temperature systems such as intermetallics fiber reinforced superalloys and the processing and high temperature properties of ceramics and carbon carbon composites This book will be a valuable resource for professionals and graduate students interested in learning about superalloys supercomposites and superceramics Superalloys 2024 Jonathan Cormier, Ian Edmonds, Stephane Forsik, Paraskevas Kontis, Corey O'Connell, Timothy Smith, Akane Suzuki, Sammy Tin, Jian Zhang, 2024-08-20 The 15th International Symposium on Superalloys Superalloys 2024 highlights technologies for lifecycle improvement of superalloys In addition to the traditional focus areas of alloy development processing mechanical behavior coatings and environmental effects this volume includes contributions from academia supply chain and product user members of the superalloy community that highlight technologies that contribute to improving manufacturability affordability life prediction and performance of superalloys **Superalloys** Blaine Geddes, Hugo Leon, Xiao Huang, 2010-01-01 This practical guide provides an introduction for understanding the compositional complexity of superalloys superalloy and the wide range of alloys developed for specific applications The basics of alloying strengthening mechanisms and structure of superalloys are explained in optimizing particular mechanical properties oxidation corrosion resistance and manufacturing

characteristics such as castability forgeability and weldability Publisher's description **Superalloys** Matthew J. Donachie, Stephen J. Donachie, 2002 This book covers virtually all technical aspects related to the selection processing use and analysis of superalloys The text of this new second edition has been completely revised and expanded with many new figures and tables added In developing this new edition the focus has been on providing comprehensive and practical coverage of superalloys technology Some highlights include the most complete and up to date presentation available on alloy melting Coverage of alloy selection provides many tips and guidelines that the reader can use in identifying an appropriate alloy for a specific application The relation of properties and microstructure is covered in more detail than in previous books

Metallurgical Coatings and Thin Films 1992 G.E. McGuire, S. Hofmann, B.D. Sartwell, 2012-12-02 One of the increasingly important requirements for high technology materials is that they possess near surface properties different to their bulk properties Specific surface properties are generally achieved through the use of these films or coatings or by modifying the structure or composition of the near surface This two volume work contains 157 papers covering a wide range of topics involving films coatings and modified surfaces All aspects of the development of deposition technologies are addressed including basic research applied research applications development and full scale industrial production The work will be of interest to materials scientists physicists electronic chemical and mechanical engineers and chemists *New Materials Society, Challenges and Opportunities* DIANE Publishing Company, 1993-07 Covers new materials technology overview advanced metals magnetic alloys superalloys powdered metals metal matrix composites advanced ceramic materials techniques advanced polymer materials description of engineering high performance polymers glossary of terms Black white photos graphs tables *Alloy Design and Characterization of γ' Strengthened Nickel-based Superalloys for Additive Manufacturing* Jinghao Xu, 2021-01-28 Nickel based superalloys an alloy system based on nickel as the matrix element with the addition of up to 10 more alloying elements including chromium aluminum cobalt tungsten molybdenum titanium and so on Through the development and improvement of nickel based superalloys in the past century they are well proved to show excellent performance at the elevated service temperature Owing to the combination of extraordinary high temperature mechanical properties such as monotonic and cyclic deformation resistance fatigue crack propagation resistance and high temperature chemical properties such as corrosion and oxidation resistance phase stability nickel based superalloys are widely used in the critical hot section components in aerospace and energy generation industries The success of nickel based superalloy systems attributes to both the well tailored microstructures with the assistance of carefully doped alloying elements and the intently developed manufacturing processes The microstructure of the modern nickel based superalloys consists of a two phase configuration the intermetallic precipitates Ni₃Al Ti Ta known as phase dispersed into the austenite matrix which is firstly introduced in the 1940s The recently developed additive manufacturing AM techniques acting as the disruptive manufacturing process offers a new avenue for producing the nickel based superalloy components

with complicated geometries However strengthened nickel based superalloys always suffer from the micro cracking during the AM process which is barely eliminated by the process optimization On this basis the new compositions of strengthened nickel based superalloy adapted to the AM process are of great interest and significance This study sought to design novel strengthened nickel based superalloys readily for AM process with limited cracking susceptibility based on the understanding of the cracking mechanisms A two parameter model is developed to predict the additive manufacturability for any given composition of a nickel based superalloy One materials index is derived from the comparison of the deformation resistant capacity between dendritic and interdendritic regions while another index is derived from the difference of heat resistant capacity of these two spaces By plotting the additive manufacturability diagram the superalloys family can be categorized into the easy to weld fairly weldable and non weldable regime with the good agreement of the existed knowledge To design a novel superalloy a Cr Co Mo W Al Ti Ta Nb Fe Ni alloy family is proposed containing 921 600 composition recipes in total Through the examination of additive manufacturability undesired phase formation propensity and the precipitation fraction one composition of superalloy MAD542 out of the 921 600 candidates is selected Validation of additive manufacturability of MAD542 is carried out by laser powder bed fusion LPBF By optimizing the LPBF process parameters the crack free MAD542 part is achieved In addition the MAD542 superalloy shows great resistance to the post processing treatment induced cracking During the post processing treatment extensive annealing twins are promoted to achieve the recrystallization microstructure ensuring the rapid reduction of stored energy After ageing treatment up to 60 65% volume fraction of precipitates are developed indicating the huge potential of formation Examined by the high temperature slow strain rate tensile and constant loading creep testing the MAD542 superalloy shows superior strength than the LPBF processed and hot isostatic pressed plus heat treated IN738LC superalloy While the low ductility of MAD542 is existed which is expected to be improved by modifying the post processing treatment scenarios and by the adjusting building direction in the following stages of the Ph D research MAD542 superalloy so far shows both good additive manufacturability and mechanical potentials Additionally the results in this study will contribute to a novel paradigm for alloy design and encourage more strengthened nickel based superalloys tailored for AM processes in the future
