Applications of Machine Learning in Volcanology

Bellina Di Lieto, Pierdomenico Romano, Silvia Scarpetta, Yosuke Aoki, Carmen Benítez, 2025-04-29 The characterization of volcano state is not a simple task due to the complexity of physics processes underway Understanding their evolution prior to and during eruptions is a critical point for identifying transitions in volcanic state Permanent monitoring networks are developed for such a purpose With the increase of the number of monitoring sites the amount of available continuous data coming from different sources infrasonic seismic GPS geochemical etc has increased exponentially and extracting the huge amount of information this data brings represents a non trivial task for researchers who are always more often looking at the potentiality of computer algorithms to find correlations among them Recent developments in the field of Machine Learning ML have proven to be very useful and efficient for automatic discrimination decision prediction clustering and information extraction in many fields including volcanology In recent times Deep Learning has seen rapid growth in its popularity along with other supervised strategies such as Support Vectors Machines and Recurrent neural networks RNN which have consistently been applied with success to broader and broader sets of applications and fields However supervised machine learning requires labels for training and obtaining these labels for large volumes of seismic and volcanic data is a very demanding and challenging task Therefore semi supervised and unsupervised methods such as Self organized Maps have been applied with success to extract relevant information from huge amounts of unlabelled data In seismic and deformative data processing these techniques are used for waveform inversion automatic picking of first arrivals and interpretation of peculiar characteristics of transients ML is helpful in the discrimination of magmatic complexes in distinguishing tectonic settings of volcanic rocks in the evaluation of correlations between volcanic signals and the chemico physical composition of erupted materials Other applications of ML in volcanology include the analysis and classification of geological geochemical and petrological static data to infer for example the possible source and mechanism of observed deposits the analysis of satellite imagery to quickly classify vast regions difficult to investigate on the ground or again to detect changes that could indicate an unrest The results obtained with the help of these algorithms would otherwise represent for researchers tasks
