Progression of Myopia in Children and Teenagers Dorian Tricard, 2021 BACKGROUND Data on myopia prevalence and progression in European children are sparse The aim of this work was to evaluate the progression of myopia in children and teenagers in a large prospective study METHODS A prospective study involving a nationwide cohort Myopia was defined as a spherical equivalent of less than or equal to 0.50 diopters Data on refractive error gender and age were collected during seven consecutive years Data were collected in 696 optical centers in France between 2013 and 2019 including 136 333 children 4-17 years old in the analysis Progression of myopia was assessed between the first visit and the last visit over up to 6.5 years RESULTS Mean age was 11.33 years 55.0% of female The proportion of children progressing more than 0.50 D per year was higher in age groups 7-9 years and 10-12 years and in children with SE ≥ 4.00 D at first visit representing 33.1%, 29.4% and 30.0% of these groups respectively In multivariate analysis progression during the first 11 to 24 months was higher in the 7 to 9 and 10 to 12 age groups 0.43 D and 0.42 D respectively for higher spherical equivalent at baseline at least 0.33 D for SE ≥ 1 D and for girls 0.35 D CONCLUSION This is the first French epidemiological study to investigate myopia progression in a large cohort of children Sex age groups and myopia severity are associated with differing rates of progression
