Computational Science - ICCS 2002 Peter M.A. Sloot, C.J. Kenneth Tan, Jack J. Dongarra, Alfons G. Hoekstra, 2003-08-01 Computational Science is the scientific discipline that aims at the development and understanding of new computational methods and techniques to model and simulate complex systems The area of application includes natural systems such as biology environmental and geo sciences physics and chemistry and synthetic systems such as electronics and financial and economic systems The discipline is a bridge between classical computer science logic complexity architecture algorithms mathematics and the use of computers in the aforementioned areas The relevance for society stems from the numerous

challenges that exist in the various science and engineering disciplines which can be tackled by advances made in this field. For instance new models and methods to study environmental issues like the quality of air water and soil and weather and climate predictions through simulations as well as the simulation supported development of cars airplanes and medical and transport systems etc.

Paraphrasing R Kenway R D Kenway Contemporary Physics 1994 There is an important message to scientists politicians and industrialists in the future science the best industrial design and manufacture the greatest medical progress and the most accurate environmental monitoring and forecasting will be done by countries that most rapidly exploit the full potential of computational science. Nowadays we have access to high end computer architectures and a large range of computing environments mainly as a consequence of the enormous stimulus from the various international programs on advanced computing e.g.

Euro-Par 2005 Parallel Processing José C. Cunha, 2005-08-18 Euro Par 2005 was the eleventh conference in the Euro Par series. It was organized by the Centre for Informatics and Information Technology CITI and the Department of Informatics of the Faculty of Science and Technology of Universidade Nova de Lisboa at the Campus of Monte de Caparica.

ECOOP '99 - Object-Oriented Programming Rachid Guerraoui, 1999-06-02 My tailor is Object Oriented. Most software systems that have been built recently are claimed to be Object Oriented. Even older software systems that are still in commercial use have been upgraded with some OO flavors. The range of areas where OO can be viewed as a must have feature seems to be as large as the number of fields in computer science. If we stick to one of the original views of OO that is to create cost effective software solutions through modeling physical abstractions the application of OO to any field of computer science does indeed make sense. There are OO programming languages OO operating systems OO databases OO specifications OO methodologies etc. So what does a conference on Object Oriented Programming really mean? I honestly don't know. What I do know is that since its creation in 1987 ECOOP has been attracting a large number of contributions and ECOOP conferences have ended up with high quality technical programs featuring interesting mixtures of theory and practice. Among the 183 initial submissions to ECOOP 99 20 papers were selected for inclusion in the technical program of the conference. Every paper was reviewed by three to five referees. The selection of papers was carried out during a 4 day program committee meeting at the Swiss Federal Institute of Technology in Lausanne. Papers were judged according to their originality presentation quality and relevance to the conference topics.

Advanced Debugging Methods Raimondas Lencevicius, 2012-09-07 Object relationships in modern software systems are becoming increasingly numerous and complex and program errors due to violations of object relationships are difficult to detect Programmers need new tools that allow them to explore objects in a large system more efficiently and to detect broken object relationships instantaneously Such tools incorporate approaches used in such areas as data visualization pattern matching and extraction database querying active databases and rule based programming The query based debugging approach developed by the author of this book is another powerful yet efficient tool to be added to the developer's tool chest Advanced Debugging Methods presents practice and tools for debugging computer programs This book proposes new powerful approaches that simplify the daunting task of debugging complex software systems Although debugging has been addressed in numerous research papers many of its methods have yet to be explored in a book length format This book helps to fill this gap by presenting an overview of existing debugging tools with motivating examples and case studies as well as presenting new state of the art debugging methods Advanced Debugging Methods will be of use to software developers looking for tools to be applied in cutting edge practice system architects looking at the relationship between software design and debugging tools and programming language researchers looking for new ideas in run time tool implementation as well as detailed descriptions of advanced implementations and university professors and graduate students who will use this book as supplementary reading for graduate courses in programming tools language implementation and advanced object oriented systems Advanced Debugging Methods is also a handy reference of currently existing debugging methodologies as well as a springboard for cutting edge research to simplify the difficult task of debugging and to facilitate the development of more robust software systems
