Rozensky, Jerry J. Sweet, Steven M. Tovian, 2012-10-21 For two decades I have been responding to questions about the nature of health psychology and how it

differs from medical psychology behavioral medicine and clinical psychology From the beginning I have taken the position that any application of psychological theory or practice to problems and issues of the health system is health psychology I have repeatedly used an analogy to Newell and Simon's General Problem Solver program of the late 1950s and early 1960s which had two major functional parts in addition to the executive component One was the problem solving core the procedural competence the other was the representation of the problem environment In the analogy the concepts knowledge and techniques of psychology constitute the core competence the health system in all its complexity is the problem environment A health psychologist is one whose basic competence in psychology is augmented by a working knowledge of some aspect of the health system Quite apparently there are functionally distinct aspects of health psychology to the degree that there are meaningful subdivisions in psychological competence and significantly different microenvironments within the health system I hesitate to refer to them as areas of specialization as the man who gave health psychology its formal definition Joseph Matarazzo has said that there are no specialties in psychology cited in the editors preface to this book

*Psychology Applied to Medicine* David W. Wells, 2015-06-16

Excerpt from *Psychology Applied to Medicine* Introductory Studies

The present essay has developed as a result of several years experience lecturing to medical students The matter presented is an attempt to bridge over the gap between psychology and medicine Medical education in the past has undoubtedly tended toward an ultramaterialistic conception of biology The psychological aspect has been postponed not merely to a postgraduate period but more often to a postpractical period a very proper study for the veteran after his years of experience Psychology is no longer merely a cultural study but is the means of solving many practical problems presented to the physician The subject should therefore be opened up to the undergraduate at least in an elementary way This gives him a better understanding of his own mental processes which will in turn broaden his conception of the factors which make for health and happiness

**Handbook of Psychology and Health, Volume I** Robert J. Gatchel, Andrew Baum, Jerome E. Singer, 2021-09-30 Originally published in 1982 this volume deals with behavioral medicine and clinical psychology Much of what psychologists had been able to contribute to the study and treatment of health and illness had to this point been derived from clinical research and behavioral treatment This volume presents some of this work providing a fairly comprehensive view of the overlap between behavioral medicine and clinical psychology Its purpose was to present some of the traditional areas of research and practice in clinical psychology that had directly and indirectly contributed to the development of behavioral medicine Before the birth of behavioral medicine which subsequently attracted psychologists from many different areas ranging from social psychology to operant conditioning the chief link between psychology and medicine consisted of the relationship albeit sometimes fragile and tumultuous between clinical psychology and psychiatry Many of the behavioral assessment and treatment methods now being employed in the field of behavioral medicine were originally developed in the discipline of clinical psychology

Medical Thinking Steven Schwartz, Timothy Griffin, 2011-10-04 Decision making is the physician's major activity Every day in doctors offices throughout the world patients describe their symptoms and complaints while doctors perform examinations order tests and on the basis of these data decide what is wrong and what should be done Although the process may appear routine even to the physicians involved each step in the sequence requires skilled clinical judgment Physicians must decide which symptoms are important whether any laboratory tests should be done how the various items of clinical data should be combined and finally which of several treatments including doing nothing is indicated Although much of the information used in clinical decision making is objective the physician's values a belief that pain relief is more important than potential addiction to pain killing drugs for example and subjectivity are as much a part of the clinical process as the objective findings of laboratory tests In recent years both physicians and psychologists have come to realize that patient management decisions are not only subjective but also probabilistic although this is not always acknowledged overtly When doctors argue that an operation is fairly safe because it has a mortality rate of only 1 % they are at least implicitly admitting that the outcome of their decision is based on probability
