Chauhan, 1994 Vaccines have historically been the most cost effective agents for the prevention of human and animal diseases This volume gives a state of the art description of the recombinant and synthetic vaccines for animal use as well as for hepatitis HIV measles etc Extensively covered are Malaria and vaccines for the control of fertility Also described are new recombinant vaccines for anti tuberculosis immunity and hantavirus hemorrhagic fever the development of genetic toxoids for pertussis and cholera and new technologies enabling the delivery of multiple doses of vaccines at a single contact point This volume with contributions by numerous experts will be a valuable addition in this rapidly developing field

Microbial Biotechnology Alexander N. Glazer, Hiroshi Nikaido, 2007-10-01 Knowledge in microbiology is growing exponentially through the determination of genomic sequences of hundreds of microorganisms and the invention of new technologies such as genomics transcriptomics and proteomics to deal with this avalanche of information These genomic data are now exploited in thousands of applications ranging from those in medicine agriculture organic chemistry public health biomass conversion to biomineral Microbial Biotechnology Fundamentals of Applied Microbiology focuses on uses of major societal importance enabling an in depth analysis of these critically important applications Some such as wastewater treatment have changed only modestly over time others such as directed molecular evolution or green chemistry are as current as today s headlines This fully revised second edition provides an exciting interdisciplinary journey through the rapidly changing landscape of discovery in microbial biotechnology An ideal text for courses in applied microbiology and biotechnology courses this book will also serve as an invaluable overview of recent advances in this field for professional life scientists and for the diverse community of other professionals with interests in biotechnology

Bioreactor Design Concepts for Viral Vaccine Production Surajbhan Sevdia, Sachin Kumar, 2024-05-12 Bioreactor Design Concepts for Viral Vaccine Production covers a range of interdisciplinary chapters from the engineering perspective of bioreactor design to the biotechnological perspectives of vector design for vaccine development The book covers bioreactor concepts such as static systems single use systems stirred tanks perfusion wave and packed beds It reviews options for efficient and economical production of human vaccines and discusses basic factors relevant for viral antigen production in mammalian cells avian cells and insect cells This book will be a great resource for those interested in implemented novel bioreactor design or experimental schemes towards intensified or enhanced vaccine production Covers the fundamentals of bioreactor designs Provides strategies for designing a successful vector based vaccine Discusses the applications of biological kinetics thermodynamics and basic substrate requirements for viral vaccine production

Novel Strategies in the Design and Production of Vaccines Sara Cohen, Avigdor Shafferman, 2013-06-29 Vaccination is one of the most efficient and cost effective methods of promoting human health and has been in clinical use for at least 200 years Nevertheless infectious diseases continue to constitute a constant threat to the well being of humanity

Common pathogens once believed to be under control acquire increased virulence and resistance to drugs while exotic microorganisms emerged from hidden reservoirs to cause yet incurable diseases in humans. These changes together with epidemic outbreaks related to political and socio economic instabilities increase the needs for the development of new advanced vaccines. In this volume devoted to the proceedings of the 39th OHOLO Conference we present some of the recent strategies for the design and production of novel vaccines. The advent of recombinant DNA technology has stimulated the production of several subunit vaccines. In spite of the obvious advantages to this approach the limited immunogenicity of many subunit candidates has hindered their development. Strategies to enhance the immunogenicity of subunit vaccines is therefore critical. Several approaches toward this goal including design of novel adjuvants and delivery systems as well as design of advantageous carriers are presented here. Among the carriers evaluated here are polypeptides, flagellin, HBV core antigen, J3 galactosidase, attenuated virions, Vaccinia, Sindbis and nonpathogenic licensed bacteria, Salmonella, Protozoa. Emilio Jirillo, Olga Brandonisio, 2010-08-08. This Ebook provides an interesting and up to date overview of Parasite Immunology in terms of a survival battle between hosts and parasites describing firstly how parasites interact with different B cell compartments and trigger a vigorous antibody response. An interesting chapter deals with new insights into immune diagnosis in Trypanosoma cruzi infection while another chapter on malaria vaccines critically reviews their development since the beginning examining the basis for failures or successes encountered in clinical trials.
