Lauritzen,2018-09-03 Construction and Demolition Waste CDW from the construction maintenance renovation and demolition of buildings and structures represents a large proportion of the waste in industrialized societies Compared to other forms such as household waste more than 90% of CDW can be used as a resource and a substitute for construction materials especially for primary natural raw materials Reuse recovery and recycling depends on the quality and market for the materials and the environmental impact of the processes for conversion of CDW from old structures to its use in new structures However the utilization today of CDW products as secondary resources is marginal Most CDW is deposited or used as fill material and the opportunities of high quality recycling are generally neglected This book presents the opportunities for the sustainable and resource efficient utilisation of CDW focusing on recycling of concrete and masonry as the major forms of CDW The recycling of gypsum timber mineral wool asphalt and other types are also described Its aim is to present a chain of value and material streams in the transformation of obsolete buildings and structures into new buildings and structures It takes a holistic view focusing on the lifecycle economy the circular economy and integrated management aspects of various scenarios ranging from high industrial urban renewal to debris removal and management after disasters and conflicts It is based on the author s 35 years of research and development combined with practical international experience within the demolition and recycling area It addresses students architects civil engineers building owners public authorities and others working in urban planning demolition and resource management in the building and construction sector and in the reconstruction of damaged buildings after disasters and wars

Structural Applications of Concrete with Recycled Solid Wastes and Alternatives for Cement Biao Hu,Jianping Lin, Nicola Nistico,Rui Hu,2025-05-27 The development and application of sustainable construction materials are crucial steps toward creating environmentally friendly and low carbon buildings However on the one hand the significant increase in solid construction waste has raised global environmental concerns On the other hand the shortage of raw materials in concrete production has triggered concern about whether they can meet the escalating demand To address these issues sustainable construction material is a promising direction such as recycled aggregate concrete geopolymer concrete limestone calcined clay cement LC3 concrete etc In order to promote the application of sustainable construction materials in practical engineering it is essential to study the structural behavior and durability of structures made with sustainable construction materials Structural design methods can be proposed based on AI technology to improve the efficiency in the utilization of sustainable construction materials **Advances in Construction and Demolition Waste Recycling F.**

Pacheco-Torgal, Francesco Colangelo, Rabin Tuladhar, Yining Ding, Zhao Xin-Yu, Alexander Koutamanis, 2025-05-02 *Advances in Construction and Demolition Waste Recycling Digital Technologies Management Processing and Environmental Assessment* presents recent research in recycling and reuse of concrete and demolition waste in construction applications. Building-Construction Design - From Principle to Detail José Luis Moro, 2024-02-19 Construction is the means by which designing architects and engineers transform a design idea into built reality. It is from this perspective that the subject of building construction design is dealt with by the architect José Luis Moro in three comprehensive volumes. Each is dedicated to the methodological, physical and functional fundamentals, the conception of a constructional solution and finally its implementation in the constructional detail. Not only do the three volumes provide extensive content, they also ensure the greatest possible clarity in the text and graphics in order to make it easier for learners to access the material. Importantly, they focus not only on conveying technical and scientific information but also on demonstrating the complex relationships and interactions between design, material and construction. Great importance was attached to developing consistent overarching and meaningful correlations between the numerous and highly diverse topics covered. After an introduction to planning theory, topics in Volume 1: Fundamentals addresses sustainability issues in the context of constructional design. This is followed by a discussion of the most important material related considerations and their consequences for the constructional application of the materials. The range of currently available industrial building products

is also presented Furthermore the essential requirements and functions that building structures must fulfill from a structural building physics building acoustics and fire protection perspective are examined In closing the book considers questions of durability
