Physiological Growth Responses to Light in Controlled Environment Agriculture Jason Lanoue,2024-12-24 Light is the primary driving force for photosynthesis and thus dictates carbon assimilation biomass production and yield in plants Light also plays an important role in a myriad of physiological and biochemical processes in plants from eliciting specific gene responses to whole plant phenomics The

lighting environment is especially important in controlled environment agriculture CEA as it supplements or fully replaces natural light to improve growth and quality Due to the advancements in lighting technologies and the rapid growth of the CEA industry lighting research has been propelled into the forefront of the plant science field Unlike organisms in the animal kingdom plants are sessile The inability to move has forced plants to evolve mechanisms to deal with the lighting environment they are in For example in environments that are rich in far red light leaf expansion and stem elongation are promoted in an effort to orient themselves in a more advantageous position to absorb photosynthetically active radiation PAR We have yet to fully understand the physiological and biochemical implications of plants under all forms of light from ultraviolet to far red The goal of this Research Topic is to collect studies which further our knowledge of how plants interact with their light environment
