North-Atlantic Passive Margins: Neotectonics and Postglacial Rebound Søren Gregersen, Peter W. Basham, 2012-12-06
 For many years the two subjects of 1 postglacial rebound and its potential for generating earthquakes and 2 the seismicity of
 passive continental margins have been of interest and concern to earth scientists on both sides of the North Atlantic New
 data and theoretical interpretations have given rise to vigorous discussions on how much the two phenomena inter relate and
 whether a significant controlling factor on seismicity in northeastern North America and Scandinavia is the crustal uplift that
 has been occurring since the latest ice age The lack of a good understanding of these phenomena presented a particular
 problem for engineering seismologists attempting to prepare accurate seismic hazard estimates for facilities both on land e
 g nuclear power stations and radioactive waste repositories and offshore e g petroleum production facilities The NATO
 Advanced Research Workshop programme provided an opportunity to bring together a group of relevant geophysicists
 geologists and geodesists from both sides of the North Atlantic and a workshop on Causes and Effects of Earthquakes at
