Lysosomal Cysteine Proteinases and Their Role in Visceral Yolk Sac Mediated Nutrition and Embryotoxicity Jeffrey Lee Ambroso, 1994 *The Role of Lysosomal Cysteine Proteases in Endocytosis-mediated Retinal Degeneration* Ronald D. Kinser, 2012 Many retinal degenerative diseases result in blindness The causes and clinical progression of these diseases are heterogeneous in nature In many instances the genes involved are known yet the molecular mechanisms leading to blindness still require elucidation Our lab utilizes the norpA mutant which undergoes light dependent retinal degeneration as a cell death model Previous characterization of norpA has shown that rhodopsin and arrestin form stabilized complexes that are internalized into the cell body in response to light Furthermore this mass endocytosis of rhodopsin leads to its aggregation and accumulation in the late endosome Accumulation of proteins in the endosomal system has been shown to lead to the permeabilization of endosomes and lysosomes subsequently allowing translocation of the resident cathepsins to the cytosol Cathepsins are lysosomal proteases that have been shown to mediate cell death when translocated from the endosomal system In this thesis I describe the role of the lysosomal cysteine proteases in endocytosis mediated retinal degeneration Using a combination of techniques in genetics cell biology and biochemistry we show the specific involvement of the cathepsin L like protease CP1 Retinal degeneration in norpA retinas can be blocked by mutation of the Cp1 gene or expression of the pan cysteine cathepsin inhibitor cystatin Conversely retinal degeneration can be accelerated in norpA retinas by overexpressing CP1 Interestingly there is a decrease in CP1 immunofluorescence accompanied by a decrease in rhodopsin colocalization in the norpA mutant compared to wild type suggesting a CP1 redistribution event in norpA retinas in response to light We also examined cathepsin involvement in a broader range of neurodegenerative disorders Although cathepsins were not implicated in many we discovered a role for cathepsins in the retinal degeneration observed in Drosophila trafficking mutants This suggests that cathepsins may be involved in a broader group of retinal degenerative disorders caused by defects in endosomal trafficking Lastly we identified a novel role for the Toll signaling pathway in endocytosis mediated cell death as mutations to Toll and dorsal block retinal degeneration These data represent a novel molecular pathway leading to cell death in Drosophila A potential link between Toll activation and cathepsins function is discussed

Role of Proteases in the Pathophysiology of Neurodegenerative Diseases Abel Lajtha, Naren L. Banik, 2007-05-08 Researchers seeking problems that offer more hope of success often avoid subjects that seem to be difficult to approach

experimentally or subjects for which experimental results are difficult to interpret The breakdown part of protein turnover in vivo particularly in nervous tissue was such a subject in the past it was difficult to measure and difficult to explore the mechanisms involved For factors that influence protein metabolism it was thought that protein content function and distribution are controlled only by the synthetic mechanisms that can supply the needed specificity and response to stimuli The role of breakdown was thought to be only a general metabolic digestion elimination of excess polypeptides We now know that the role of breakdown is much more complex it has multiple functions it is coupled to turnover and it can affect protein composition function and synthesis In addition to eliminating abnormal proteins breakdown has many modulatory functions it serves to activate and inactivate enzymes modulate membrane function alter receptor channel properties affect transcription and cell cycle form active peptides and much more The hydrolysis of peptide bonds often involves multiple steps many enzymes and cycles such as ubiquitination and often requires the activity of enzyme complexes Their activation modification and inactivation can thus play an important role in biological functions with numerous families of proteases participating The specific role of each remains to be elucidated

Mechanism for Selective Secretion of a Lysosomal Cysteine Protease/cathepsin L by Transformed Mouse Fibroblasts Jianming Dong, Sackler School of Graduate Biomedical Sciences, 1990

and interaction **Proteases in Physiology and Pathology** Sajal Chakraborti, Naranjan S. Dhalla, 2017-09-14 Using a multidisciplinary approach this book describes the biochemical mechanisms associated with dysregulation of proteases and the resulting pathophysiological consequences. It highlights the role and regulation of different types of proteases as well as their synthetic and endogenous inhibitors. The role of proteases was initially thought to be limited to general metabolic digestion. However, we now know that the role of protein breakdown is much more complex and proteases have multiple functions; they are coupled to turnover and can affect protein composition, function, and synthesis. In addition to eliminating abnormal proteins, breakdown has many modulatory functions including activating and inactivating enzymes, modulating membrane function, altering receptor channel properties, affecting transcription and cell cycles, and forming active peptides. The ubiquity of proteases in nature makes them an important target for drug development. This in-depth comprehensive is a valuable resource for researchers involved in identifying new targets for drug development. With its multidisciplinary scope, it bridges the gap between fundamental and translational research in the biomedical and pharmaceutical industries, making it thought-provoking reading for scientists in the field.

The Serpin Family Margarethe Geiger, Felix Wahlmüller, Margareta Furtmüller, 2015-11-13 The book provides a comprehensive overview on the biology, genetics, and cellular functions of serpins, serine protease inhibitors in health and disease. With over 1000 members, serpins are the most diverse family of protease inhibitors. Latest groundbreaking research findings are presented and broaden the understanding on inhibitory and non-inhibitory serpins not only in mammalian organisms but also in insects, worms, plants, and viruses.

Cell Apoptosis Research Advances Carter R. Kettleworth, 2007 Apoptosis is the regulated form of cell death. It is a complex process defined by a set of characteristic morphological and biochemical features that involves the active participation of affected cells in a self-destruction cascade. This book presents research from around the world.

Medical Aspects of Proteases and Protease Inhibitors Nobuhiko Katunuma, 1997 The work presents articles on proteases and their inhibitors as mediators of biological functions. Topics addressed include cathepsin B and L, MHC, and peptide interaction; procathepsin L; cysteine proteinases; selective neuronal cell death; HIV and influenza virus; tumor invasion; gingivitis; bacterial infection. Readers: professionals in the area of molecular medicine, biochemists, molecular biologists, clinical pharmacologists, pharmaceutical companies.

Proteases in Human Diseases Sajal Chakraborti, Tapati Chakraborti, Naranjan S. Dhalla, 2017-07-13 This book bridges the gap between fundamental research and biomedical and pharmacological applications on proteases. It represents a comprehensive overview of the multifaceted field of proteases in the cellular environment and highlights the recently elucidated functions of complex proteolytic systems in different diseases. Several established investigators have elucidated the crucial role of proteases in biological processes, including how proteolytic function and regulation can be combined to develop new strategies of therapeutic interventions. Proteases form one of the largest and most diverse families of enzymes known. It is now clear that proteases are involved in every aspect of life functions of an organism. Under physiological conditions, proteases are regulated

by their endogenous inhibitors however when the activity of proteases is not regulated appropriately disease processes can result in So there is absolute need for a stringent control of proteolytic activities in cells and tissues Dysregulation of proteases may cause derangement of cellular signalling network resulting in different pathophysiological conditions such as vascular remodelling atherosclerotic plaque progression ulcer and rheumatoid arthritis Alzheimer disease cancer metastasis tumor progression and inflammation Additionally many infective microorganisms require proteases for replication or use proteases as virulence factors which have facilitated the development of protease targeted therapies for a variety of parasitic diseases **Cumulated Index Medicus** ,2000
