Theory and Computation of Electromagnetic Fields Jian-Ming Jin,2011-03-16 This book is intended to serve as a textbook for an entry level graduate course on electromagnetics first seven chapters and for an advanced level graduate course on computational electromagnetics last five chapters Whereas there are several textbooks available for the graduate electromagnetics course no textbook is available for the advanced course on computational electromagnetics This book is intended to fill this void and present electromagnetic theory in a systematic manner so that students can advance from the first course to the second without much difficulty Even though the first part of the book covers the standard basic electromagnetic theory the coverage is different from that in existing textbooks This is mainly the result of the undergraduate curriculum reform that occurred during the past two decades Many universities reduced the number of required courses in order to give students more freedom to design their own portfolio As a result only one electromagnetics course is required for undergraduate students in most electrical engineering departments in the country New graduate students come to take the graduate electromagnetics course with a significant difference in their knowledge of basic electromagnetic theory To meet the challenge to benefit all students of backgrounds this book covers both fundamental theories such as vector analysis Maxwell s equations and boundary conditions and transmission line theory and advanced topics such as wave transformation addition theorems and scattering by a layered sphere

Optical Electromagnetic Field Analysis Using Python Kotaro Kajikawa,Takayuki Okamoto,2025-07-31 In this book Kajikawa and Okamoto explain how to use Python to calculate and visualize the optical response of microscopic structures and systems Throughout the authors provide varied examples to instruct readers in the application of theoretical knowledge to real world scenarios Electromagnetic field analysis is often necessary to determine the optical response of materials with microscopic structures Although the principles are widely described the manual calculation and visualization of results are not and remain challenging Python is the ideal language to use for this as it has a large functional library for visualizing analysis results and is suitable for programming beginners to use at low cost so it has many advantages over languages like Fortran BASIC and C Here the authors introduce the application of Python to various electromagnetic field analysis scenarios in the field of nanophotonics The first half of the book describes cases in which there is an analytical solution for the structure and addresses scenarios such as scattering and absorption in spherical and cylindrical structures and complex structures such as rotating ellipsoids sphere aggregated structures and hemispherical

structures The second half describes methods including rigorous coupling wave analysis finite difference time domain method and discrete dipole approximation for numerically solving varied structures This book enables readers to conduct their own electromagnetic field analysis quickly cheaply and accurately without in depth study of other complicated and time consuming approaches or programs This book is invaluable for researchers and postgraduate students working in the fields of optics and photonics Additionally the contents are useful not only for those conducting electromagnetic field analysis but also those simulating physical chemical and biological phenomena
