**Analytical Methods in Radiative Transfer**

Alexander Kokhanovsky, Vijay Natraj, Dmitry Efremenko, 2025-09-04 Provides in depth knowledge of the physics of radiative transfer In *Analytical Methods in Radiative Transfer* a team of distinguished researchers delivers a comprehensive exploration of solutions to practical problems of modern atmospheric optics related to solar light interaction with the terrestrial atmosphere and the remote sensing of clouds aerosols and gases The authors describe analytic methods in radiative transfer that help explain atmospheric phenomena The book includes discussions on the interaction of solar light with the atmosphere Readers will also benefit from thorough reviews of various analytical radiative transfer techniques for various turbid media including media with phase functions extended in the forward direction and also semi infinite non absorbing weakly absorbing and strongly absorbing light scattering media *Analytical Methods in Radiative Transfer* also includes A thorough introduction to exact solutions of the radiative transfer equation including situations of single scattering as well as isotropic and Rayleigh scattering A comprehensive exploration of approximate solutions for scalar radiative transfer including single and multiple light scattering separation and the case of semi infinite media such as snow In depth examinations of the applications of analytical methods in atmospheric radiative transfer including aerosol remote sensing cloud remote sensing and the remote sensing of trace gases Perfect for meteorologists climatologists and graduate students studying physics *Analytical Methods in Radiative Transfer* is also an indispensable resource for geophysicists seeking a practical exploration of modern atmospheric optics

*Radiative Transfer in Moving Media* K.K. Sen, S.J. Wilson, 1998-06 The advancement of observational techniques has led to the discovery of a large number of stars exhibiting complex spectral structures This necessitates the search for new methods to study the radiative transfer in such stars This book presents mathematical methodologies developed for solving radiation transfer problems in moving media and stellar atmospheres

*Radiative Transfer In Curved Media* K K Sen, S J Wilson, 1990-02-01 Most of the methods described in this book can be used with cosmetic modifications to solve transfer problems of greater complexity All attempts have been made to make the book self contained

*Numerical Methods in Multidimensional Radiative Transfer* Guido Kanschat, Erik Meinköhn, Rolf Rannacher, Rainer Wehrse, 2008-12-24 Traditionally radiative transfer has been the domain of astrophysicists and climatologists In nuclear technology one has been dealing with the analogous equations of neutron transport In recent years applications of radiative transfer in combustion machine design and in medicine became more and more important In all these disciplines one uses the radiative transfer equation to model the formation of the radiation field and its propagation For slabs and spheres effective algorithms for the solution of the transfer equation have been available for quite some time In addition the analysis of the equation is quite well developed Unfortunately in many modern applications the approximation of a 1D geometry is no longer adequate and one has to consider the full 3D dependencies This makes the modeling immensely more

intricate The main reasons for the difficulties result from the fact that not only the dimension of the geometric space has to be increased but one also has to employ two angle variables instead of one and very often one has to consider frequency coupling due to motion or redistribution in spectral lines In actual calculations this leads to extremely large matrices which in addition are usually badly conditioned and therefore require special care Analytical solutions are not available except for very special cases Although radiative transfer problems are interesting also from a mathematical point of view mathematicians have largely neglected the transfer equation for a long time

#### **Moment Methods for Radiative Transfer** Matthias

Schäfer, 2008 Radiative Transfer Hélène Frisch, 2022-05-26 This book discusses analytic and asymptotic methods relevant to radiative transfer in dilute media such as stellar and planetary atmospheres Several methods providing exact expressions for the radiation field in a semi infinite atmosphere are described in detail and applied to unpolarized and polarized continuous spectra and spectral lines Among these methods the Wiener Hopf method introduced in 1931 for a stellar atmospheric problem is used today in fields such as solid mechanics diffraction theory or mathematical finance Asymptotic analyses are carried out on unpolarized and polarized radiative transfer equations and on a discrete time random walk Applicable when photons undergo a large number of scatterings they provide criteria to distinguish between large scale diffusive and non diffusive behaviors typical scales of variation of the radiation field such as the thermalization length and specific descriptions for regions close and far from boundaries Its well organized synthetic view of exact and asymptotic methods of radiative transfer makes this book a valuable resource for both graduate students and professional scientists in astrophysics and beyond

**Light Scattering in Inhomogeneous Atmospheres** Edgard G. Yanovitskij, 2012-12-06 This book is aimed at studying the scattering of monochromatic radiation in plane inhomogeneous media We are dealing with the media whose optical properties depend on a single spatial coordinate namely of a depth The most widely known books on radiation transfer for instance 1 S Chandrasekhar *Radiative Transfer* Oxford Clarendon Press 1950 RT 2 V V Sobolev *Light Scattering in Planetary Atmospheres* New York Pergamon Press 1975 LSPA 3 H C van de Hulst *Multiple Light Scattering Tables Formulas and Applications* Vol 1 2 New York Academic Press 1980 MLS treat mainly the homogeneous atmospheres However as known the actual atmospheres of stars and planets basins of water and other artificial and natural media are not homogeneous This book deals with the model of vertically inhomogeneous atmosphere which is closer to reality than the homogeneous models This book is close to the aforementioned monographs in its scope of problems and style Therefore I guess that a preliminary knowledge of the contents of these books particularly of the book by Sobolev would facilitate the readers task substantially On the other hand

all concepts problems and equations used in this book are considered in full in Chap 1 So it will be possible for those readers who do not possess the above knowledge to understand this book A general idea about the content of the book can be gained from both the Introduction and the Table of Contents      *Lecture Notes on New Methods in Radiative Transfer* I.
