**Bioactivity Bioaffinity** Thomas Scheper,2003-06-30 The immobilized biocatalyst IMB is a key component of  
biotransformation systems that are used to transform substrates to desired products The improvement of biocatalyst  
properties has a direct influence on the overall effectiveness of the process based on the biotransformation The basic  
catalytic characteristics of biocatalyst that are followed include kinetic properties pH optima stability and inhibition The  
investigation of catalytic properties of immobilized enzymes is still a time consuming procedure and is not always simple In  
the 1980s a major effort was made to standardize the rules by which IMB is characterized The Working Party of EFB on  
immobilized biocatalysts has formulated principles of individual methods among them the requirement of kinetic  
characterization 1 It was recommended to use a packed bed reactor equipped with temperature control and with infinite flow  
circulation The system should be equipped with a post column unit to measure the time dependence of the product or  
substrate concentration 2 3 the most commonly used analytical methods being spectrophotometry chemiluminescence  
automatic titration bioluminescence chromatography polarimetry and biosensors based on the oxygen electrode There are  
two main drawbacks to the application of these methods 1 The need to vary the analytical principles depending on the  
chemical and physical chemical properties of analytes 2 In some cases mainly in the study of hydrolytic enzymes the natural substrate  
must be replaced by an artificial one that is chromolytic chromogenic chemiluminiscent bioluminiscent or fluorescent

Membrane Fusion Techniques Nejat Düzgüneş,1993 The critically acclaimed laboratory standard Methods in Enzymology  
is one of the most highly respected publications in the field of biochemistry Since 1955 each volume has been eagerly
