

New Types of Transitive Functions and Minimal Systems

Mohammed Nohhas Mirad

Abstract-- The purpose of this paper is to give new types of topological b-transitive functions and new types of b-minimal functions. We obtain their characterizations and investigate some of its properties. The main results are the following propositions:

- 1) Every topologically b-transitive function is a topological transitive function and every open set is b-open set but the converse not necessarily true..
- 2) Every b-minimal function is a minimal function as every open set is b-open set, but the converse not necessarily true.

Keyword: Topologically b-transitive, b-minimal functions, b-continuous, b-irresolute

I. INTRODUCTION

Functions and of course irresolute functions stand among the most important notions in the whole of mathematical science. Various interesting problems arise when one considers openness. Its importance is significant in various areas of mathematics and related sciences. In 1972, Crossley and Hildebrand [17] introduced the notion of irresoluteness. Many different forms of irresolute functions have been introduced over the years. Andrijevic [2] introduced a new class of generalized open sets in a topological space, the so-called b-open sets. This type of sets was discussed by Elcici and Caldas [5] under the name of γ -open sets. The class of b-open sets is contained in the class of semi-preopen sets and contains all semi-open sets and preopen sets. The class of b-open sets generates the same topology as the class of preopen sets. A subset A of (X, τ) is said to be b-open [2] (or γ -open [5]) (resp. α -open [6]) if $A \subseteq \text{Int}(Cl(A)) \cup Cl(\text{Int}(A))$ (resp. $A \subseteq \text{Int}(Cl(\text{Int}(A)))$). The complement of b-open set is called b-closed. The family of all b-open (resp. α -open) subsets of (X, τ) will be denoted by $\text{BO}(X)$ (resp. τ^α or $\alpha\text{O}(X)$). Throughout this paper, the word "space" will mean

topological space. Recently there has been some interest in the notion of a locally closed subset of a space. According to Bourbaki [16] a subset S of a space (X, τ) is called locally closed if it is the intersection of an open set and a closed set. Ganster and Reilly used locally closed sets in [13] and [14] to define the concept of LC-continuity, i.e. a function $f : (X, \tau) \rightarrow (Y, \sigma)$ is LC-continuous if the inverse with respect to f of any open set in Y is closed in X . The study of semi open sets and semi continuity in topological spaces was initiated by Levine [6]. Bhattacharya and Lahiri [8] introduced the concept of semi generalized closed sets in topological spaces analogous to generalized closed sets which was introduced by Levine [5]. The collections of semi-open, semi-closed sets and α -sets in (X, τ) will be denoted by $SO(X, \tau)$, $SC(X, \tau)$ and τ^α respectively. Njastad [7] has shown that τ^α is a topology on X with the following properties: $\tau \subseteq \tau^\alpha$, $(\tau^\alpha)^\alpha = \tau^\alpha$ and $S \in \tau^\alpha$ if and only if $S = U \setminus N$ where $U \in \tau$ and N is nowhere dense (i.e. $\text{Int}(Cl(N)) = \emptyset$) in (X, τ) . Hence $\tau = \tau^\alpha$ if and only if every nowhere dense (nwd) set in (X, τ) is closed. Clearly every α -set is semi-open and every nwd set in (X, τ) is semi-closed. Andrijevic [1] has observed that $SO(X, \tau^\alpha) = SO(X, \tau)$, and that $N \subseteq X$ is nwd in $(X, \tau^\alpha) \Leftrightarrow N$ is nwd in (X, τ) . In this paper, we will define a new class of topological transitive maps called topological b-transitive and a new class of b-minimal functions. We will also study some of their properties.

II. PRELIMINARIES AND DEFINITIONS

In this section, we recall some of the basic definitions. Let X be a space and $A \subseteq X$. The intersection (resp. closure) of A is denoted by $\text{Int}(A)$ (resp. $Cl(A)$).

Definition 2.1

[6] A subset A of a topological space X will be termed semi-open (written S.O.) if and only if there exists an open set U such that $U \subseteq A \subseteq Cl(U)$.

The History of Continua Stewart Shapiro, Geoffrey Hellman, 2020-12-01 Mathematical and philosophical thought about continuity has changed considerably over the ages Aristotle insisted that continuous substances are not composed of points and that they can only be divided into parts potentially There is something viscous about the continuous It is a unified whole This is in stark contrast with the prevailing contemporary account which takes a continuum to be composed of an uncountably infinite set of points This volume presents a collective study of key ideas and debates within this history The opening chapters focus on the ancient world covering the pre Socratics Plato Aristotle and Alexander The treatment of the medieval period focuses on a relatively recently discovered manuscript by Bradwardine and its relation to medieval views before during and after Bradwardine's time In the so called early modern period mathematicians developed the calculus and with that the rise of infinitesimal techniques thus transforming the notion of continuity The main figures treated here include Galileo Cavalieri Leibniz and Kant In the early part of the nineteenth century Bolzano was one of the first important mathematicians and philosophers to insist that continua are composed of points and he made a heroic attempt to come to grips with the underlying issues concerning the infinite The two figures most responsible for the contemporary orthodoxy regarding continuity are Cantor and Dedekind Each is treated in an article investigating their precursors and influences in both mathematics and philosophy A new chapter then provides a lucid analysis of the work of the mathematician Paul Du Bois Reymond to argue for a constructive account of continuity in opposition to the dominant Dedekind Cantor account This leads to consideration of the contributions of Weyl Brouwer and Peirce who once dubbed the notion of continuity the master key which unlocks the arcana of philosophy And we see that later in the twentieth century Whitehead presented a point free or gunky account of continuity showing how to recover points as a kind of extensive abstraction The final four chapters each focus on a more or less contemporary take on continuity that is outside the Dedekind Cantor hegemony a predicative approach accounts that do not take continua to be composed of points constructive approaches and non Archimedean accounts that make essential use of infinitesimals
