Small Clinical Trials Institute of Medicine, Board on Health Sciences Policy, Committee on Strategies for Small-Number-Participant Clinical Research Trials, 2001-01-01 Clinical trials are used to elucidate the most appropriate preventive diagnostic or treatment options for individuals with a given medical condition Perhaps the most essential feature of a clinical trial is that it aims to use results based on a limited sample of research participants to see if the intervention is safe and effective or if it is comparable to a comparison treatment Sample size is a crucial component of any clinical trial A trial with a small number of research participants is more prone to variability and carries a considerable risk of failing to demonstrate the effectiveness of a given intervention when one really is present This may occur in phase I safety and pharmacologic profiles II pilot efficacy evaluation and III extensive assessment of safety and efficacy trials Although phase I and II studies may have smaller sample sizes they usually have adequate statistical power which is the committee's definition of a large trial Sometimes a trial with eight participants may have adequate statistical power statistical power being the probability of rejecting the null hypothesis when the hypothesis is false Small Clinical Trials assesses the current methodologies and the appropriate situations for the conduct of clinical trials with small sample sizes This report assesses the published literature on various strategies such as 1 meta analysis to combine disparate information from several studies including Bayesian techniques as in the confidence profile method and 2 other alternatives such as assessing therapeutic results in a single treated population e.g. astronauts by sequentially measuring whether the intervention is falling above or below a preestablished probability outcome range and meeting predesigned specifications as opposed to incremental improvement *Translational and Experimental Clinical Research* Daniel P. Schuster, William J. Powers (MD.), 2005 This volume is a comprehensive textbook for investigators entering the rapidly growing field of translational and experimental clinical research The book offers detailed guidelines for designing and conducting a study and analyzing and reporting results and discusses key ethical and regulatory issues Chapters address specific types of studies such as clinical experiments in small numbers of patients pharmacokinetics and pharmacodynamics and gene therapy and pharmacogenomic studies A major section describes modern techniques of translational clinical research including gene expression identifying mutations and polymorphisms cloning transcriptional profiling proteomics cell and tissue imaging tissue banking evaluating substrate metabolism and in vivo imaging **Developments in Statistical Evaluation of Clinical Trials** Kees van Montfort, Johan Oud, Wendimagegn Ghidye, 2014-10-07 This book describes various ways of approaching and interpreting the data produced by clinical trial studies with a special emphasis on the essential role that biostatistics plays in clinical trials Over the past few decades the role of statistics in the evaluation and interpretation of clinical data has become of paramount importance As a result the standards of clinical study design conduct and interpretation have undergone substantial improvement The book includes 18 carefully reviewed chapters on recent developments in clinical trials and their statistical

evaluation with each chapter providing one or more examples involving typical data sets enabling readers to apply the proposed procedures The chapters employ a uniform style to enhance comparability between the approaches Personnel Needs and Training for Biomedical and Behavioral Research National Research Council (U.S.).
