Methods in Enzymology Vol. 26 C.H.W. Hirs, 1972 **Fatty Acid Metabolism and its Regulation**, 1984-01-01 Fatty Acid Metabolism and its Regulation **Amino Acids, Peptides and Proteins** R. C. Sheppard, 1974 Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research Written by experts in their specialist fields the series creates a unique service for the active research chemist supplying regular critical in depth accounts of progress in particular areas of chemistry For over 80 years the Royal Society of Chemistry and its predecessor the Chemical Society have been publishing reports charting developments in chemistry which originally took the form of Annual Reports However by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series Specialist Periodical Reports was born The Annual Reports themselves still existed but were divided into two and subsequently three volumes covering Inorganic Organic and Physical Chemistry For more general coverage of the highlights in chemistry they remain a must Since that time the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry Some titles have remained unchanged while others have altered their emphasis along with their titles some have been combined under a new name whereas others have had to be discontinued The current list of Specialist Periodical Reports can be seen on the inside flap of this volume *Biophysical Approaches* Edward D. Korn, 2013-04-17 The short period since the publication of Volume 1 of Methods in Membrane Biology has been a time of momentous progress Calorimetry electron spin and nuclear magnetic resonance X ray diffraction and freeze cleavage electron microscopy reinforced by biochemical analyses and enzymatic studies have led to universal acceptance of a generalized membrane model All membrane biologists would agree that a major element of all biological membranes is a bilayer of phospholipids which in some instances also contains other lipids notably sterols and glycolipids The fatty acid composition of the lipids of most membranes is such that the lipids are above their transition temperatures in their normal environment so that the bilayer is fluid The microviscosity of the fatty acyl groups decreases progressively down the chain so that at the hydrocarbon interior of the bilayer the lipid phase has a viscosity approximating that of olive oil at room temperature As a consequence of this membrane fluidity a phospholipid molecule is very mobile within the plane of the membrane moving a distance of about 1.2 μm in 1 s but the movement of a phospholipid molecule from one side of the membrane bilayer to the other flip flop is very slow The lipid bilayer is an essentially inert and rather impermeable structure as shown by many studies with model systems Proteins of course provide the catalytic components of the membranes as well as playing a significant structural role Handbook of Synthetic Substrates H.C. Hemker, 2012-12-06 The need for a handbook on the use of synthetic substrates for assay of proteases of the coagulation and fibrinolytic systems became evident several years ago during the activities of the Subcommittee on Synthetic Substrates of the International Committee on Thrombosis and Haemostasis ICTH Production of such a handbook which was recommended during discussions of the ICTH

at its meeting in London in 1979 was made possible by the generous efforts of Professor HC Hemker with the aid of several contributors with particular interests in the use of synthetic substrates in coagulation and fibrinolysis As current Chairman and Secretary General of the ICTH we would like to express our sincere thanks to Professor Hemker for producing this handbook and look forward to seeing the benefits of this tremendous effort reflected in the advancement of our understanding of thrombosis and hemostasis and the transfer of such knowledge into improved diagnosis and treatment of thrombotic and hemorrhagic disorders

Craig M Jackson Professor of Biological Chemistry Washington University School of Medicine St Louis MO Chairman ICTH Harold R Roberts Professor of Internal Medicine University of North Carolina Chapel Hill NC Secretary General ICTH ix Foreword The advent of synthetic substrates for the study of blood coagulation and fibrinolysis was a significant step forward in the investigation of these systems Both basic research and clinical laboratory investigations can profit from these advanced tools

Thermal Biosensors Bioactivity Bioaffinity Thomas Scheper, 2003-06-30 The immobilized biocatalyst IMB is a key component of biotransformation systems that are used to transform substrates to desired products The improvement of biocatalyst properties has a direct influence on the overall effectiveness of the process based on the biotransformation The basic catalytic characteristics of biocatalyst that are followed include kinetic properties pH optima stability and inhibition The investigation of catalytic properties of immobilized enzymes is still a time consuming procedure and is not always simple In the 1980s a major effort was made to standardize the rules by which IMB is characterized The Working Party of EFB on immobilized biocatalysts has formulated principles of individual methods among them the requirement of kinetic characterization 1 It was recommended to use a packed bed reactor equipped with temperature control and with infinite flow circulation The system should be equipped with a post column unit to measure the time dependence of the product or substrate concentration 2 3 the most commonly used analytical methods being spectrophotometry chemiluminescence automatic titration bioluminescence chromatography polarimetry and biosensors based on the oxygen electrode There are two main drawbacks to the application of these methods 1 The need to vary the analytical principles depending on the chemical and physical chemical properties of analytes 2 In some cases mainly in the study of hydrolytic enzymes the natural s

Kalivas,1995-08-01 Optimization problems occurring regularly in chemistry vary from selecting the best wavelength design for optimal spectroscopic concentration predictions to geometry optimization of atomic clusters and protein folding Numerous optimization tactics have been explored to solve these problems While most optimizers maintain the ability to locate global optima for simple problems few are robust against local optima convergence with regard to difficult or large scale optimization problems Simulated annealing SA has shown a great tolerance to local optima convergence and is often called a global optimizer The optimization algorithm has found wide use in numerous areas such as engineering computer science communication image recognition operation research physics and biology Recently SA and variations thereof have shown considerable success in solving numerous chemical optimization problems The main thrust of this book is to demonstrate the use of SA in a wide range of chemical problems The potentiality of SA GSA and other modifications of SA to serve specific needs in a variety of chemical disciplines are covered A detailed discussion on SA and GSA is given in Chapter 1 presenting the theoretical framework from which a computer program can be written by the reader The remainder of the book describes applications of SA type algorithms to a diverse set of chemical problems The final chapter contains an algorithm for GSA written in the MatLab programming environment This program can be easily adapted to any optimization problem and with only slight modifications can be altered to perform SA A general flowchart is also given *Immobilization of Enzymes and Cells* José M. Guisán,2008-02-05 Enzymes and whole cells are able to catalyze the most complex chemical processes under the most benign experimental and environmental conditions In this way enzymes and cells could be excellent catalysts for a much more sustainable chemical industry However enzymes and cells also have some limitations for nonbiological applications fine chemistry food chemistry analysis therapeutics and so on Enzymes and cells may be unstable difficult to handle under nonconventional conditions poorly selective toward synthetic substrates and so forth From this point of view the transformation from the laboratory to industry of chemical processes catalyzed by enzymes and cells may be one of the most complex and exciting goals in biotechnology For many industrial applications enzymes and cells have to be immobilized via very simple and cost effective protocols in order to be re used over very long periods of time From this point of view immobilization simplicity and stabilization have to be strongly related concepts Over the last 30 years a number of protocols for the immobilization of cells and enzymes have been reported in scientific literature However only very few protocols are simple and useful enough to greatly improve the functional properties of enzymes and cells activity stability selectivity and related properties Applications of Infrared, Raman, and Resonance Raman Spectroscopy in Biochemistry Frank S.
