Modern Chemical Technology And Emission Control:

Modern Chemical Technology and Emission Control M.B. Hocking, 2012-12-06 This text of applied chemistry considers the interface between chemistry and chemical engineering using examples of some of the important processes in industries. Integrated with this is detailed consideration of measures which may be taken for avoidance or control of potential emissions. This new emphasis in applied chemistry has been developed through eight years of experience gained from working in industry in research development and environmental control fields plus twelve years of teaching here using this approach. It is aimed primarily towards science and engineering students as well as to environmentalists and practising professionals with responsibilities or an interest in this interface. By providing the appropriate process information back to back with emissions and control data the potential for process fine tuning is improved for both raw material efficiency and emission control objectives. This approach also emphasizes integral process changes rather than add on units for emission control. Add on units have their place when rapid action on an urgent emission problem is required or when control simply is not feasible by process integral changes alone. Obviously fundamental process changes for emission containment are best conceived at the design stage. However at whatever stage process modifications are installed this approach to control should appeal to the industrialist in particular in that something more substantial than decreased emissions may be gained.

Pecsok RL Ed, 1972 *Modern Control Methods for Chemical Process Systems* Joel Anthony Paulson, 2017 Strong trends in chemical engineering have led to increased complexity in plant design and operation which has driven the demand for improved control techniques and methodologies. Improved control directly leads to smaller usage of resources, increased productivity, improved safety and reduced pollution. Model predictive control (MPC) is the most advanced control technology widely practiced in industry. This technology initially developed in the chemical engineering field in the 1970s was a major advance over earlier multivariable control methods due to its ability to seamlessly handle constraints. However limitations in industrial MPC technology spurred significant research over the past two to three decades in the search of increased capability. For these advancements to be widely implemented in industry they must adequately address all of the issues associated with control design while meeting all of the control system requirements including: The controller must be insensitive to uncertainties including disturbances and unknown parameter values. The controlled system must perform well under input actuator and state constraints. The controller should be able to handle a large number of interacting variables efficiently as well as nonlinear process dynamics. The controlled system must be safe, reliable and easy to maintain in the presence of system failures/faults. This thesis presents a framework for addressing these problems in a unified manner. Uncertainties and constraints are handled by extending current state of the art MPC methods.

to handle probabilistic uncertainty descriptions for the unknown parameters and disturbances Sensor and actuator failures at the regulatory layer are handled using a specific internal model control structure that allows for the regulatory control layer to perform optimally whenever one or more controllers is taken offline due to failures Non obvious faults that may lead to catastrophic system failure if not detected early are handled using a model based active fault diagnosis method which is also able to cope with constraints and uncertainties These approaches are demonstrated on industrially relevant examples including crystallization and bioreactor processes *Modern Chemical Technology - Volume 2 , Revised Edition (pages 193 - 384)*. A Real-Time Approach to Process Control William Y. Svrcek, Donald P. Mahoney, Brent R. Young, 2014-02-10 With resources at a premium and ecological concerns paramount, the need for clean, efficient, and low-cost processes is one of the most critical challenges facing chemical engineers. The ability to control these processes, optimizing one, two, or several variables, has the potential to make more substantial savings in time, money, and resources than any other single factor. Building on the success of the previous editions, this new third edition of *A Real Time Approach to Process Control* employs both real industry practice and process control education without the use of complex or highly mathematical techniques, providing a more practical and applied approach. Updated throughout, this edition includes a brand new chapter on Model Predictive Control (MPC). Now includes wireless and web-based technologies. Covers bio-related systems. Details the new multivariable control measure developed by the authors. Includes PowerPoint slides and solutions to Workshop problems on the accompanying website http://www.wiley.com/go/svrcek_real_time_3e. From the reviews of previous editions: "Would appeal to practising engineers due to its hands-on feel for the subject matter. But more importantly, the authors present these concepts as fundamentals of chemical engineering in a way that is consistent with how professors teach at the universities." *Chemical Engineering Process CEP*. The book has been beautifully crafted. *Engineering Subject Centre*. Provides a refreshing approach to the presentation of process analysis and control. *The Chemical Engineer*. **Chemical and Biological Process Dynamics and Control (Color Edition)** George Stephanopoulos, 2025-01-31 George Stephanopoulos' new book is an introductory text to the theory and practice of dynamic chemical and biological process engineering. It is intended to address the educational needs of a first undergraduate course in process dynamics and control and to complement advanced undergraduate or graduate courses on the same subject. It is also useful for practicing engineers who want to deepen their understanding in the foundational aspects of process dynamics and control. The book contains 31 chapters organized in 10 parts.
