Modern Optical Methods in Gas Dynamic Research

Darshan Dosanjh, 2012-12-06 This volume is based on material prepared by the contributors to the symposium on Progress in Gas Dynamic Research by Optical Methods held on May 25-26, 1970 in the Department of Mechanical and Aerospace Engineering at Syracuse University. The contents focus on experimental and analytical aspects of contemporary optical methods as applied in modern research on high speed and/or high temperature gaseous flows. State-of-the-art recent research results and possible research applications of spectroscopy, spectral interferometry, pulse laser holographic interferometry, laser as a diagnostic and plasma generating tool, and the analysis of plasma by light scattering constitute part of the subject matter of this volume. The emerging importance and impact of recent laser developments on optical diagnostics of gas dynamic and gas physics phenomena is a recurring theme throughout the volume. Diverse applications of the shock tube to process gases to high temperature equilibrium conditions and the study of important characteristics of these radiating gases by contemporary spectroscopic methods are discussed in papers by Nicholls, Wurster, and Wares et al. Refractivity index measurements have long been extensively used for investigating gas dynamic and aerodynamic flows. However, the recent availability of the laser as a light source has brought significant improvements in the more conventional optical methods such as schlieren photography and interferometry as reported here in Alcock's paper. More recent laser developments have resulted in several completely new optical diagnostic methods.

**Modern Techniques in Applied Molecular**

**Spectroscopy** Francis M. Mirabella, 1998-04-06 A complete guide to choosing and using the best analytical technique for the job at hand. Today's new generation of spectroscopic instrumentation allows for more accurate and varied measurements than ever before. At the same time, increasingly powerful user-friendly PC hardware and software make running those instruments relatively child's play. However, although they may have solved many of the problems traditionally associated with conducting molecular spectroscopic analyses, these refinements tend to obscure inherent technical challenges which, if not taken into consideration, can seriously undermine a research initiative. *Modern Techniques in Applied Molecular Spectroscopy* gives scientists and technicians the knowledge they need to address those challenges and to make optimal selection and use of contemporary molecular spectroscopic techniques and technologies. While editor Francis Mirabella and contributors provide ample background information about how and why individual techniques work, they concentrate on practical considerations of crucial concern to researchers working in industry. For each technique covered, they provide expert guidance on method selection, sample preparation, troubleshooting, data handling, and analysis, and more. Adhering principally to mid-IR molecular spectroscopic techniques, they clearly describe the guiding principles behind characteristics of and suitable applications for transmission spectroscopy, reflectance spectroscopies, photoacoustic spectroscopy, infrared and

Raman microspectroscopy fiber optic techniques and emission spectroscopy Modern Techniques in Applied Molecular Spectroscopy is an indispensable working resource for analytical scientists and technicians working in an array of industries

**Modern Methods for Analysing Archaeological and Historical Glass** Koen H. A. Janssens, 2013-01-29 The first scientific volume to compile the modern analytical techniques for glass analysis Modern Methods for Analysing Archaeological and Historical Glass presents an up to date description of the physico chemical methods suitable for determining the composition of glass and for speciation of specific components This unique resource presents members of Association Internationale pour l'Histoire du Verre as well as university scholars with a number of case studies where the effective use of one or more of these methods for elucidating a particular cultural historical or historical technical aspect of glass manufacturing technology is documented UV Spectroscopy B.J. Clark, T. Frost, M.A. Russell, 1993-04-30 This book is intended as an introductory text It starts at the very fundamentals of the interaction of light and matter and progresses through the laws of light absorption instrumentation and standards to the newer chemometric techniques Other chapters cover colour structural aspects of UV spectroscopy detection in high performance liquid chromatography and fluorescence
