

Gazdar et al. 1985], and Bresnan and Kaplan's Lexical-Functional Grammars LFG.

CSLI-4 makes a perfect couple with CSLI-3, continuing to present syntactic approaches and unification-based implementation, suitable for all the grammatical formalisms discussed in the books.

The landscape in the valley of syntax is governed by GB, as the highest achievement towards universality. GB realizes a rich set of universal principles, the grammars of the particular languages being obtained as parametrizations of a Universal Grammar. All the other syntactic approaches (including GPSG, LFG, logic-based grammars) could be labeled as stages in the evolution of Chomsky's ideas from observational to descriptive and to explanatory adequacy. In their trend to universality, explicitness, and rigor, they inevitably decreased in specification of empirical detail. The linguistic pole for all the contemporary syntactic theories or tools is the effort to attain the *lexical meaning*, as a min-max (or equilibrium) principle: minimality, coming from semantics, and maximality, coming from syntax. Another basic idea is that clause structure is largely predictable from the semantics of predicates: these theories agree in deriving canonical structures from lexical semantics and it is (somehow) surprising "how little needs to be stipulated beyond lexical meaning" (T. Wasow).

CSLI-4 reveals the strong developments in unification-based implementations, stemming from different research directions but converging to grammars in which declarative and procedural interpretations can coexist. The grammatical version of unification, viewed as a (directed acyclic) graph-combining process, suggests many other linguistically and logically relevant operations: generalization (as the dual of unification), disjunction, negation, overwriting. Along with GPSG and LFG, Martin Kay's Functional Unification Grammar, logic-based grammars (Definite Clause Grammar, Extra-position Grammar, Gapping Grammar, etc. [Dahl and Saint-Dizier 1985]), Shieber's PATR-II grammars represent a "least common denominator" of the various unification-based formalisms but are still powerful. Appendix A in CSLI-4 contains the machine-interpretable form as an instructive example, handling increasingly complex constructs. As a corollary of all the formalisms and implementations, even those not (strictly) based on unification, like Wehrli (1984), is the emphasis on lexical properties in syntax and semantics.

This pair of books represents an important and useful effort on the part of the authors to bring these linguistic theories and tools, as well as the implementation trends, to the computational linguistics community.

MULTILINGUAL ASPECTS OF INFORMATION TECHNOLOGY

This is a book for a first acquaintance with computational linguistics. It gives an overview of some of the main fields of interest, namely machine translation, natural language interfaces, and the lexicon.

The book is directed towards user-oriented applications, especially systems on the market and under development. Some basic theoretical linguistic questions encountered in such development work are mentioned rather than discussed, and the book does not tell its readers too much about more fundamental research.

In accordance with this practical scope, the topic of the lexicon is presented in two distinct chapters, one on general lexicology and lexicography and the other one on terminology and terminography, and no link is established on a level of word linguistics.

The machine translation chapter introduces the basic terms, for instance in the field of system design (interlingual, transfer, direct, or machine-aided human vs. human-aided machine translation). This chapter is also the most explicit one with respect to implementation principles. The authors mention, among others, the advantages of modularity in structured programming. Another type of structured modularity is undoubtedly as important as this: the conceptual distinction between grammar and programming, with a formalism level as the interface. There are too many publications on the market which do not distinguish for example syntax, parsing formalism, and parser in a clean way. The authors of this book seem to make distinctions of this kind, and they also advocate a sound degree of modularity between the various parts of grammar (syntax, semantics, ...). In an introductory book, however, the principles of these distinctions should, to my taste, be made explicit. There are so many bad examples.

As a first superficial introduction to computational linguistics the book is certainly good, but the word "multilingual" in the title appears to be a bit misleading. Machine translation is of course multilingual, but what the authors report about terminography and natural language interfaces is only in some accidental cases more
