

# SYMPTOMS OF MULTIPLE SCLEROSIS

## **Tingling**

This is the first symptom that may help doctors diagnose MS in a patient. MS affects the entire central nervous system; therefore, there are high chances that several nerves in the brain are damaged. When damage occurs, there might be malfunctions in sending signals from the brain to other parts of the body.

## **Numbness**

Numbness always follows a tingling sensation. When the nerves that connect the body and spinal cord are damaged, there is noticeable numbness in some parts such as fingers, face, legs and arms.

## **Pain**

As said, MS is a chronic disease that may cause noticeable pain and involuntary muscle movement. Chronic pain is common in MS conditions according to the National Multiple Sclerosis Society.

## **Spasms**

Spasticity is also common in MS conditions. Most patients encounter muscle stiffness and other uncontrollable and painful joint movements, especially in body parts such as the legs and back.

## **Vision Issues**

Impaired vision is one of the most common problems that many MS patients face because of the inflammation that affects the optic nerves and central vision. In some cases, blindness is the worst; and the first stages of vision problems include blurred eyesight and double vision.

## **Fatigue**

Eighty percent of people suffering from other mentioned symptoms above experienced unexplained fatigue and weakness. It usually affects the legs and causes difficulties while walking or standing.

## **Cognitive Problems**

Thousands of MS patients experienced several cognitive malfunctions including memory problems, language issues and difficulty staying focused. Aside from these, several emotional and mental problems may also occur, such as depression and anxiety.

## **Impaired Balance**

Coordination problems are also common in MS. Most patients experience decreased mobility, dizziness, lightheadedness and vertigo.
